No El Embarcadero Analysis

TRAFFIC ANALYSIS FOR CLOSURE OF EL EMBARCADERO

During the project design process, two project development scenarios were studied: the project as defined in the Project Description; and a "No El Embarcadero" scenario, where El Embarcadero would be closed entirely between Grand Avenue and Lakeshore Avenue. Because the preliminary traffic analysis for the No El Embarcadero scenario identified five significant and unavoidable impacts to nearby intersections, closure of El Embarcadero was dropped from further consideration. Impacts associated with the Existing Plus Project with No El Embarcadero variant are discussed below. Table E-1 shows the intersection LOS for key intersections for the No El Embarcadero variant.

Impact TRANS-E1 (El Embarcadero Closure): Under the Existing Conditions Plus Project with No El Embarcadero the Santa Clara Avenue/Grand Avenue intersection would degrade to LOS F during the PM peak hour. (S)

Mitigation Measure TRANS-E1: Optimization of the signal timing as described in Mitigation Measure TRANS-1 would improve the intersection to LOS D during the PM peak hour. (LTS)

Impact TRANS-E2 (El Embarcadero Closure): Under the Existing Conditions Plus Project with No El Embarcadero the MacArthur Boulevard/Grand Avenue intersection would degrade to LOS F during the PM peak hour. (S)

Mitigation Measure TRANS-E2: Implementation of Mitigation Measure TRANS-8 would improve traffic operations to LOS D during the PM peak hour. (LTS)

Impact TRANS-E3 (El Embarcadero Closure): The Existing Conditions plus Project with No El Embarcadero would cause total intersection average vehicle delay at the Lake Park Avenue/Lakeshore Avenue intersection to increase by 148.2 seconds during the AM peak hour and would cause the intersection to degrade to LOS E during the PM peak hour. (S)

Mitigation Measure TRANS-E3: Implementation of Mitigation Measure TRANS-2 would improve the intersection to LOS D during the PM peak hour, but would leave the intersection operating at LOS F, with an average vehicle delay of 83.2 seconds, during the AM peak hour. After mitigation the average vehicle delay would be 6.0 seconds higher than no project and no mitigation. To achieve a less-than-significant level of impact would require providing an additional lane at the intersection. A southbound lane could be added on Lakeshore Avenue by removing parking along the west side of the street; however, this additional mitigation would not be feasible due to the impacts on parking considered to be essential to local businesses along the west side of Lakeshore Avenue. (SU)

			PM			A	8.4	A	8.4

Notes:
Shaded values indicate a potential significant impact.
[1] LOS = Level of Service
[2] Average control delay in seconds per vehicle
[3] HCM LOS is not applicable for the stop-controlled approaches of this intersection.
[4] Defined as a downtown intersection
[5] The worst approach control delays and LOS are reported for side street stop-controlled intersections.
Source: Dowling Associates, 2007.

Impact TRANS-E4 (El Embarcadero Closure): The Existing Conditions Plus Project with No El Embarcadero would cause the MacArthur Boulevard/Lakeshore Avenue total intersection average vehicle delay to increase by 94.8 seconds during the PM peak hour. (S)

Mitigation Measure TRANS-E4: Implementation of Mitigation Measure TRANS-3 would reduce the total intersection average vehicle delay by 110 seconds during the PM peak hour.

However, the intersection would remain at LOS F. After mitigation, the intersection would operate at a total average vehicle delay that would be 16.1 seconds lower than the delay with no project and no mitigation. (LTS)

Impact TRANS-E5 (El Embarcadero Closure): The Existing Conditions plus Project with the No El Embarcadero would cause the total intersection average vehicle delay to increase by 4.6 seconds at the 27th Street/Bay Place/Harrison Street intersection during the PM peak hour where the intersection is at LOS F without the project. (S)

Mitigation Measure TRANS-E5: Implementation of Mitigation Measure TRANS-4 would reduce the total average vehicle delay at the intersection. With signal optimization the delay would be 45.3 seconds less than with no project and no mitigation. (LTS)

Cumulative Conditions (2025) Plus Project with No El Embarcadero. The following section describes the impacts associated with the No El Embarcadero Variant under cumulative conditions. Table E-2 shows LOS and delay for key intersections under the Cumulative plus Project with No El Embarcadero Variant.

Impact TRANS-E6 (El Embarcadero Closure): Under the Cumulative Plus Project with No El Embarcadero, the total intersection average vehicle delay at the Santa Clara Avenue/Grand Avenue intersection would increase by 16.7 seconds during the AM peak hour where the intersection is LOS E without the project and the intersection would degrade to LOS F during the PM peak hour. (S)

Mitigation Measure TRANS-E6: Optimization of the signal timing at the Santa Clara Avenue/Grand Avenue intersection as described in Mitigation Measure TRANS-1 would improve traffic operations. With signal optimization the intersection would be LOS E (71.8 seconds average delay) during the AM peak hour and LOS F (95.8 seconds average delay) during the PM peak hour for the Project with No El Embarcadero Variant. No other feasible mitigation measures were identified at this intersection. After mitigation, the cumulative impact would remain significant and unavoidable. (SU)

Impact TRANS-E7 (El Embarcadero Closure): Under the Cumulative Plus Project with No El Embarcadero, the MacArthur Boulevard/Grand Avenue intersection would degrade to LOS F during the PM peak hour. (S)

Mitigation Measure TRANS-E7: With the modifications at the MacArthur Boulevard/Grand Avenue intersection as described under Mitigation Measure TRANS-8 the delay would be reduced from 180.6 seconds to 117.8 for the Project with No El Embarcadero, but the interesection would remain at LOS F during the PM peak hour. No other feasible mitigation measures were identified at this intersection. After mitigation, the cumulative impact would remain significant and unavoidable. (SU)

Notes:
Shaded values indicate a potential significant impact.
[1] LOS = Level of Service
[2] Average control delay in seconds per vehicle
[3] HCM LOS is not applicable for the stop-controlled approaches of this intersection.
[4] Defined as a downtown intersection
[5] The worst approach control delays and LOS are reported for side street stop-controlled intersections.
Source: Dowling Associates, 2007.

Impact TRANS-E8 (El Embarcadero Closure): Under the Cumulative Plus Project with No El Embarcadero the Lake Park Avenue/Lakeshore Avenue intersection would degrade the intersection to LOS F during the AM and PM peak hours. (S)

Mitigation Measure TRANS-E8: Modification of the Lake Park Avenue/Lakeshore Avenue intersection as described under Mitigation Measure TRANS-2 would reduce the delay from 279.2 seconds to 136.1 during the AM peak hour, but the intersection would remain at LOS F. The mitigation measure would reduce the delay from 88.1 seconds to 57.6 seconds during the PM peak hour, but the intersection would also remain at LOS E. No other feasible mitigation measures were identified at this intersection. After mitigation, the cumulative impact would remain significant and unavoidable. (SU)

Impact TRANS-E9 (El Embarcadero Closure): Under the Cumulative Plus Project with No El Embarcadero the MacArthur Boulevard/Lakeshore Avenue intersection would degrade to LOS E during the AM peak hour and the total intersection average vehicle delay would increase by 287.4 seconds during the PM peak hour. (S)

Mitigation Measure TRANS-E9: Modification of the MacArthur Boulevard/Lakeshore Avenue intersection as described under Mitigation Measure TRANS-3 would improve the intersection to LOS D during the AM peak hour and would reduce the delay from 374.2 seconds to 165.7 seconds during the PM peak hour, but the intersection would also remain at LOS F. No other feasible mitigation measures were identified at this intersection. After mitigation, the cumulative impact would remain significant and unavoidable. (SU)

June 2007

Executive Summary

The City of Oakland is proposing to implement Measure DD project components in four areas in proximity to Lake Merritt. These project components are referred to as the 12th Street Reconstruction, Lakeshore Avenue, the Boat House and Channel projects.

As part of the planning for these projects, the City retained LSA Associates to prepare an Environmental Impact Report. LSA Associates retained HortScience, Inc. to assess 269 trees proposed for removal in the following manner:

1. **Evaluation of tree health and structural condition.** Among the 269 trees, 6 were dead and 84 were in poor condition. Seventy-eight (78) trees were in either good or excellent condition. Trees were generally mature in development.
2. **Evaluation of the potential to relocate.** The potential to successfully relocate the 263 living trees was evaluated considering the health and structural condition, species response to relocation, age and maturity and site conditions for each tree. Three trees were identified as having good potential for relocation.
3. **Assessment of the risk of tree failure.** The risk that a tree would fail and injure a person or damage property was evaluated using the methods contained in *A Photographic Guide to the Evaluation of Hazard Trees in Urban Areas (*Matheny & Clark. 1994 2nd edition). Trees were rated on a scale of 3 to 12, where 12 represents highest risk. No trees were rated 11 or 12. Three trees received rating of 10; seven trees received rating of 9.
4. **Appraisal of value.** The value of 263 living trees was established using the trunk formula method identified in the *Guide for Plant Appraisal* (9th edition). This is the standard resource for appraisal of the value of landscape trees and considers the species, size (trunk diameter), condition and location. Using this method, the value of the trees was $371,950.
5. **Evaluation of the economic and environmental benefits.** Using STRATUM, one of the i-Tree suite of software products developed by the USDA Forest Service, the contributions of the trees to energy conservation, air quality, carbon dioxide removal and other values were calculated.
6. **Evaluation of proposed project plans and impacts to trees.** Proposed plans for each of the project areas were reviewed. In almost all cases, the surveyed trees fell into areas proposed for development.

I recommend preservation of 5 trees and removal of 264 (including 6 dead trees). The five trees recommended for relocation or preservation in place include: relocation of coast live oak #80 (12th Street area) and preservation in place of trident maple #258 (12th Street area), southern magnolias #121 and #127 (12th Street area) and flowering cherry #35ee (Lakeshore area).

Introduction and Overview

The City of Oakland is proposing to implement Measure DD project components in several areas in proximity to Lake Merritt. Four project components have been proposed:

- **12th Street Reconstruction.** Re-development of the area between the west end of the Lake and the Henry Kaiser Auditorium, including removal and realignment of existing 12th and 14th Streets. Nearly all trees between the Kaiser Auditorium and the Lake in this area would be removed by the project and were surveyed.
- **Lakeshore Avenue.** Landscape improvements in the area between Lakeshore Avenue and the Lake, from the pergola to the intersection with 12th Street. Surveyed trees were evenly distributed throughout the project area.
- **Boat House.** Project encompasses renovation of the Boat House structure on the north side of the Lake including its conversion to a restaurant, new landscape treatment and replacing the retaining wall on the edge of the water. Trees were concentrated in the area immediately adjacent to the structure.
- **Channel.** Restoration and enlargement of the channel from the west end of the Lake to the intersection with I-880. Surveyed trees were concentrated near overcrossings and along the south side of the channel adjacent to the Oakland Unified School District property.

As part of the environmental review process for these projects, the City retained LSA Associates to prepare an Environmental Impact Report (EIR). Proposed tree removal is one potential impact being evaluated in the EIR. LSA Associates retained HortScience, Inc. to assess the trees proposed for removal. This report presents the following information:

1. Evaluation of tree health and structural condition.
2. Evaluation of the potential for relocation.
3. Assessment of the risk of tree failure.
4. Appraisal of value.
5. Evaluation of the economic and environmental benefits.
6. Evaluation of proposed project plans and impacts to trees.
7. Recommendations for action.

Survey Methods

Trees were evaluated in March 2007. The scope of the survey was identified by the City of Oakland and focused on trees that were scheduled for removal within the proposed project areas. Trees scheduled for preservation were not assessed. The City provided plans for individual projects. Trees were identified by number, species and trunk diameter. We have retained the numbering system. Trees were not, however, tagged with numerically coded tags.

The survey method consisted of the following steps:

1. Verifying the tree's presence as noted on project plans.
2. Identifying the species.

Exhibit 6b: City of Oakland Measure DD Implementation Project Final Environmental Impact Report, adopted February 13, 2008

Survey method continued.

3. Measuring the diameter of the trunk at 54" above grade. Where trees had more than one stem, the diameter of each stem was measured.

4. Visually assessing tree health and structural condition using a 6-point scale where 0=dead, 1=poor and 5=excellent condition.

5. Recording the tree's stage of development as young, semi-mature, mature and over-mature where the stages are defined as follows:
   - Young. Newly planted or just established. Actively growing. May still be staked to nursery stake.
   - Semi-mature. Established in the site. Actively growing. Has not yet reached mature height.
   - Mature. Growth rate has declined as tree reached mature height and crown spread.
   - Overmature. Senescent. Declining in health and/or structure.

6. Identifying site conditions that might limit the capacity to relocate the trees including slope and proximity of streets, buildings and other infrastructure.

7. Identifying any present or potential conflicts between the tree and associated infrastructure such as pavement displacement, obstruction of signs and nuisance fruit litter. Conflicts were rated as:
   - Yes. Conflict with infrastructure is currently present.
   - No. No conflict exists at present and the potential for one in the future is low.
   - Potential. A conflict with infrastructure may develop during the plant's lifetime.

8. Rating the risk associated with the failure of each tree. The assessment method is detailed in the ***Risk Assessment*** section.

9. Recording the presence of defects in structure, insects or diseases and other aspects of development.

Description of Trees

Two hundred sixty-nine (269) trees were evaluated, representing 43 species (Table 1, following page). This total does not include six trees identified on the plans but could not be located in the field. In the 12th Street area, missing trees were flowering cherry #24, southern magnolia #70, eucalyptus #110, California incense cedar #149 and yew #215. In the Boat House area, Australian tea tree #11 was not found.

A group of five California incense cedars was not included on the site plans for the 12th Street, area and were added to the survey as #1000-1005. There also appeared to be two trees #157 on the 12th Street plans. We noted them as #157 and #157.1.

In general, disease and insect pressure was minimal with the exception of Monterey pines as described below. Trees in poor condition were most often mature and overmature in development. It appeared that irrigation had been inadequate for some time.

Pine pitch canker and red turpentine beetle were present in Monterey pines. There is little that can be done to treat these problems. In addition, it is likely that mature pines and those in poor condition were infested by the 5-spined engraver beetle, as this pest attacks stressed and senescent trees. The presence of engraver beetles could not be verified from our ground survey as the pest is small and normally restricted to the upper crown.

Sunscald and bleeding were present along the trunks of flowering cherries. These are abiotic disorders rather than biotic in nature. Sunscald develops under conditions of high summer temperatures and water stress. These conditions are most problematic when the cherries are present in small cut-outs in the pavement of parking lots. Bleeding is a response to mechanical wounding.

The surveyed trees were planted as part of landscape development. Although species such as coast live oak, bigleaf maple and coast redwood are native to the Oakland area, they were not indigenous to the site. It is possible that a small group of Fremont cottonwoods and individual boxelder trees in the channel area were seeded into the area and may be considered indigenous to the site.

12th Street Reconstruction Area

Of the 165 trees in this area, flowering cherry (42) and California incense cedar (34) were the most numerous. Cherries were a mix of semi-mature and mature individuals, concentrated in the parking lot of the Kaiser Auditorium where they had been planted in small pavement cut-outs. Condition was generally good.

In contrast, the incense cedars were located in the street area between the parking lot and the Lake. Over two-thirds of the incense cedars were either dead or in poor condition. Trees in good condition were young and in protected locations.

Among the remaining species were 16 southern magnolias in the Auditorium parking lot. The magnolias were mature and semi-mature in development, located in pavement cut-outs or planters, and evenly divided between fair and good condition. Fifteen (15) Monterey pines were mature and overmature in development, and in poor condition. A 9" pine (#9) was in good condition. Ten (10) crabapples were mature in development and in poor condition.

Also notable were a mature trident maple (#258) in good condition and a mature yew (#139) in fair condition.

Among living trees approximately 20% had either an existing or potential conflict with infrastructure. Twelve (12) trees had displaced pavement whether sidewalk, curb or retaining walls. Another 16 had the potential to do so. Southern magnolia accounted for 15 of the existing and potential conflicts. Tree species with messy fruit included crabapple and sweetgum. These resulted in seven situations where fruit falls onto pavement, and two where this may occur in the future.

Boat House

The 21 trees surveyed near the Boat House were concentrated either along the Lake itself or near the building. The dominant tree in this area, a huge specimen eucalyptus, will be retained and was not evaluated. Five weeping willows were located in the lawn between the building and Lakeside Drive. Two (#14, 24) were in poor condition, two (#9, 15) were fair and tree #25 was in good condition. All were mature in development, distinguished by the amount of decay in the trunk and the structure of the crown.

Four Australian brush cherries were on the east side of the structure. These were mature in development and in fair condition. They had been topped in the past, presumably to reduce the production of messy fruit.

An overmature Monterey pine (#42`) was 43" in diameter and in fair condition. It was located at the east end of the project area.

Species with messy fruit, notably Australian brush cherry and Victorian box accounted for seven existing conflicts with pavement, mostly sidewalk and driveways.

Channel area

Fifty-nine (59) trees were assessed in the area of the channel. The most common species was Lombardy poplar (21), which had been widely used as a landscape tree. Also present was a small group of poplars just west of the 10th Street overcrossing. Although they lack the crown form typical of this cultivar, we identified these as Lombardy poplars as they appeared to be sprouts from either a fallen or removed tree. Lombardy poplars were mature in development and in generally fair condition.

Also present in this area were eight Monterey pines and eight boxelders. Both were located on the south side of the channel near the Oakland Unified School District property. Pines were mature and overmature, and in poor condition. One pine was dead. Boxelders were mature in development, evenly divided between poor and fair condition.

Among the 58 living trees in this area, 14 conflicts with infrastructure were present: four associated with fruit drop from Japanese privet trees and 10 conflicts with infrastructure on the south side of the channel where boxelder and Monterey pine trees are close to the School District parking lot and retaining wall. I identified 26 trees that have the potential to develop conflicts with infrastructure including six semi-mature trees located near pavement. In addition, I believe the 20 Lombardy poplars in this area have the potential to develop conflicts in the future due to the species known trait of suckering from the roots.

Lakeshore Drive

Among the 25 trees in the Lakeshore Drive project area were seven flowering cherries at the east end. The cherries were generally in poor condition. Also present were a number of mature and overmature trees of a variety of species. Included in this group were three Monterey pines, two blackwood acacias and a red flowering gum. All had significant defects in structure including lean and a history of failure.

Near the pergola were a mature California incense cedar and a Chinese elm. Both trees were in fair overall condition. A scaffold limb had failed from the elm, which had poor overall structure. The upper crown of the incense cedar was dead. Because the trees are growing in close proximity to the structure both had one-sided crowns. For example, the incense cedar on the east side of the pergola had live branches only on the east. I identified both of these trees as conflicting with infrastructure as they must be pruned to provide clearance to the structure.

Fern pine #111 has displaced the adjacent curb and represents a significant conflict with infrastructure.

Potential for Relocation

Trees were evaluated for their potential to be transplanted successfully. Four factors influence this potential:

- **Species response.** Some species have a higher rate of transplant success than do others. This response is not the same as success in establishing nursery stock, i.e., planting trees grown in containers. Rather it focused on the ability to relocate established trees. For example, coast redwood and coast live oak are generally regarded as easy to relocate while Monterey pine and eucalyptus are not.
- **Health and structural condition.** Trees in good health and with good structure are more likely to survive the relocation process than those in poor health or those possessing significant structural defects.
- **Age and maturity.** Young trees are far more likely to be successfully relocated than mature trees.
- **Site considerations.** The best candidate for relocation is a tree located in an open area on flat ground, away from other trees and infrastructure. Trees growing on slopes are more difficult to excavate and replant.

Each of these factors, in and of itself, may limit the potential for relocation. For example, even a semi-mature Monterey pine in excellent condition growing in an open lawn is unlikely to survive relocation due to the species response, and its inability to regenerate new roots following planting.

Using the four factors noted above, the potential to relocate each of the 263 living trees was assessed (Table 2). Given the age and condition of the surveyed trees, almost all (230) had poor suitability for relocation. Thirty (30) trees had moderate potential including 22 flowering cherries. Three (3) trees were assessed as having good potential for relocation:

Tree No.	Location	Species	Diameter
80	12th St.	Coast live oak	18,12
146	12th St.	Canary Island pine	19
35ee	Lakeshore	Flowering cherry	5

Our assessment is not to be considered a recommendation for action. It is only an evaluation of potential success, based on the species present, their health and structural condition, age and maturity, and relevant site constraints. See ***Evaluation of Impacts & Recommendations for Action*** for recommendations.

Exhibit 6b: City of Oakland Measure DD Implentation Project Final Environmental Impact Report, adopted February 13, 2008

Risk Assessment

Tree risk assessment is the systematic process of evaluating the potential for a tree or one of its parts to fail and, in so doing, injure people or damage property. All trees have the potential to fail. The degree of risk will vary with the size of the tree, type and location of the defect, tree species, and the nature of the target. Tree risk assessment involves three components:

1. a tree with the potential to fail,
2. an environment that may contribute to that failure, and
3. a person or object that would be injured or damaged (i.e. the target).

Tree Risk Rating System

All of the surveyed trees were assessed using the procedure contained in *A Photographic Guide to the Evaluation of Hazard Trees in Urban Areas* (N. Matheny & J. Clark. 1994 (2nd edition. International Society of Arboriculture. Champaign IL). Following a visual inspection of tree health and structural condition, the part of the tree most likely fail within the next year was identified (e.g. branch, stem, whole tree). The target that would be impacted by this part of the tree was then identified. The risk associated with the tree was evaluated using the following components:

Failure potential (4 points) - identifies the most likely failure and rates the likelihood that the structural defect(s) will result in failure within the next year. The part of the tree most likely to fail was assessed using the following scale:

1 - low - defects are minor (e.g. dieback of twigs, small wounds with good woundwood development)
2 - medium - defects are present and obvious (e.g. lean or bow that has developed over time, cavity encompassing 10-25% of the circumference of the stem, codominant stems without included bark)
3 - high - compounding and/or significant defects present (e.g. severe lean, cavity encompassing 30-50% of the circumference of the stem, multiple pruning wounds with decay along a branch)
4 - severe - defects are very severe (e.g. partial uprooting of leaning tree, decay conks along the main stem, cavity encompassing more than 50% of the stem)

Size of defective part (4 points) - rates the size of the part most likely to fail. Larger parts present a greater potential for damage. Therefore, the size of the failure affects the potential for injury or damage. The scoring system was as follows:

1 - most likely failure less than 6" in diameter
2 - most likely failure 6 - 18" in diameter
3 - most likely failure 18 - 30" in diameter
4 - most likely failure greater than 30" in diameter

Target rating (4 points) - rates the use and occupancy of the area that would be struck by the defective part. For the project areas, the following scoring was employed:

1 - occasional use (e.g. lawn areas, lake, lagoon)
2 - intermittent use (e.g. trails, benches)
3 - frequent use (e.g. street parking, street crossings)
4 - constant use (e.g. major streets, structures)

The points in each category were added to obtain the overall hazard rating, with 3 being the minimum and 12 being the maximum value.

Risk rating = failure potential + size of defective part + target rating

Sixty-one (61) of the surveyed trees had ratings of 7 or greater (Table 3). No trees received ratings of 11 or 12. Three trees received ratings of 10:

- #11, Monterey pine in the Channel area.
- #79, a blackwood acacia along Lakeshore.
- #83, California incense cedar in the 12th St. area. This tree was dead. Although the two stems were relatively small in diameter (8,7"), they would fall into 12th Street.

Five trees in the 12th Street area and one tree each in the Channel and Lakeshore areas received ratings of 9:

- #2, a 27" Monterey pine in poor condition.
- #14, a 32" Monterey pine in poor condition.
- #89, an 18" Blackwood acacia in poor condition.
- #94, a multi-stem Monterey pine in poor condition.
- #168, a 40" Monterey pine in poor condition.
- #27, a 26" Monterey pine in the Channel area in poor condition.
- #91, a 33" Monterey pine in the Lakeshore area in fair condition but leaning.

Seventeen (17) trees had ratings of 8; 33 had ratings of 7.

Under a normal management regime, trees with the highest rating, i.e. 10, would be abated first, followed by those with ratings of 9, then 8, then 7. Removal would be the most appropriate abatement for 58 of the 60 trees with risk ratings of 7 or greater. Trees in this group were poor condition and/or overmature in development, often with poor crown form and structure. Coast live oak #80 and Lombardy poplar #41 could be pruned to abate the risk of failure.

Appraisal of Value

To establish the value of the surveyed trees, I employed the standard methods found in *Guide for Plant Appraisal*, 9th edition (published in 2000 by the International Society of Arboriculture, Champaign IL). In addition, I referred to *Species Classification and Group Assignment* (2004), a publication of the Western Chapter of the International Society of Arboriculture (Orange CA). These two documents outline the methods employed in tree appraisal.

The value of landscape trees is based upon four factors: size, species, condition and location. Size is measured as trunk diameter at 54" above grade. The species factor considers the adaptability and appropriateness of the plant in the Oakland area. The *Species Classification and Group Assignment* lists recommended species ratings and evaluations and I used those ratings. Condition reflects tree health and structural integrity.

Table 3. Tree Risk Assessment. Lake Merritt Area. Oakland CA. Note: only ratings of 7 or greater are presented.

Tree No.	Species	Target	Most likely failure	Overall rating (range: 3 to 12)
12th Street

39	Lombardy poplar	Landscape	Stem	7
43	Lombardy poplar	Access road	Stem	7
26	Monterey pine	Parking lot	Branch	7
41	Lombardy poplar	Access road	Stem	7
1	Monterey pine	Path	Branch	7
Lakeshore				
79	Blackwood acacia	Sidewalk	Whole tree	10
91	Monterey pine	Lawn	Branch	9
99	Monterey pine	Path	Branch	8
108	Blue gum	Sidewalk	Stem	8
78	Blackwood acacia	Lawn	Whole tree	7
110	Red flowering gum	Path	Branch	7
62	Chinese elm	Walkway	Branch	7

The location factor considers the site, placement and contribution of the tree in the surrounding landscape. In this case, the trees were located in the downtown area of Oakland, in either street or landscape settings. They provided shade and visual appeal.

Using the methods described above, I established the value of the 263 living trees to be $371,950. This total is based on 161 trees in the 12th Street area with a value of $273,150; 19 trees in Boat House area with a value of $28,900; 58 trees in the Channel area with a value of $45,500 and 25 trees in the Lakeshore area with a value of $24,400.

Assessment of Environmental & Economic Benefits

Urban trees are recognized as providing a range of environmental and economic benefits to a community. The question has long been: what is the value of these benefits? Scientists at the USDA Forest Service's Pacific Southwest Research Station have been at the leading edge of addressing this question. Their research has produced a computer application that uses tree inventory data to quantify the structure, function, value and management needs (http://www.itreetools.org/street_trees/introduction_step1.shtm). STRATUM (Street Tree Management Tool for Urban Forest Managers) was designed to assess populations of street trees.

The computer application, STRATUM, uses tree inventory data to quantify the annual benefits provided by trees with respect to:

- **Energy conservation** due to reduced natural gas used in winter and reduced energy use (air conditioning) in summer.
- **Reductions in stormwater** runoff.
- **Improvements in air quality** through removal of air pollutants (O_3, NO_X, SO_2, PM_{10})1 and reduced emissions from power plants (NO_X, SO_2, PM_{10}, VOC). The model accounts for potential negative effects of some trees on air quality due to the emission of biogenic volatile organic compounds (these chemicals react with NO_X from human sources, such as vehicle emissions, to form O_3).
- **Sequestration of carbon dioxide** (CO_2) and reduced emissions from power plants due to reduced energy use. The model accounts for release of CO_2 as trees die and decompose.
- **Aesthetics** and other tangible and intangible benefits provided by trees as reflected in property values. The model accounts for the value of trees based on their size and species, which provide an indication of their value in the landscape.

STRATUM uses tree growth and benefit models for urban tree species in 19 national climate zones. For this project, reference data for the "California North & Central Coast" zone, Berkeley, was used along with site-specific data on species, size and numbers of trees as surveyed in this tree assessment.

[1] CO_2 – carbon dioxide; O_3 – ozone; NO_x – Nitrous oxides; SO_2 – sulfur dioxide; PM_{10} – particulate matter, 10 microns or less in diameter.

Table 4. Appraisal of Value. Lake Merritt Area. Oakland CA.

Tree No.	Location	Species	Trunk Diameter	Appraised Value
1	12th St.	Washington hawthorn	7	$300
2	12th St.	Monterey pine	27	$1,150

In using STRATUM, I made the following assumptions about species growth and mortality, trunk diameter, condition and location for each group of trees:

1. **The 264 trees proposed for removal at the four project locations.** I used the species, diameter and condition information from the field survey (see ***Tree Survey Forms***). For multiple stem trees, I calculated the total cross-sectional area of all stems, then used the equivalent single trunk diameter.

2. **The 521 trees scheduled to be planted as part of the new landscape.** Tree species, quantities and stock sizes were obtained using proposed landscape plans for each of the three areas to be replanted. I established the trunk diameter by using the *Species Classification & Group Assignment* published by the Western Chapter International Society of Arboriculture. There are two editions of this document. The first (1992) provides average trunk diameters for 48" box nursery stock; the second (2004) covers 24" box size. I assumed that trees planted as 15 gal. would have a trunk diameter of 1". I assumed that all 521 trees would be in the good condition at planting.

3. **Trees from #2, five years after planting.** Using the group of 521 trees from #2, I assumed a 1% mortality rate over the four years following planting. This resulted in 500 trees. I selected individual trees to "die" based on my knowledge of species ease of transplanting and overall performance in the landscape. I assumed that all trees would be the size of 48" box trees by this time. Where trees larger than 48" box were specified, I increased the trunk diameter proportionally. I also assumed that the condition of well-adapted species would be consist of 60% good, 30% fair and 10% poor. In contrast, condition of less-well adapted species would be 30% good, 60% fair and 10% poor.

4. **Trees from #3, 20 years after planting.** Using the 500 trees from #3, I assumed an overall mortality of 10% from year 5 to year 20, resulting in a population of 450 trees at year 20. I assumed that fast-growing species would be three times the size of a 48" box tree while slow-growing species would be twice the size. I used the same proportions of good, fair and poor described above.

For purposes of comparison, the computer application assigns dollar values to the energy savings, air quality effects, stormwater benefits, CO_2 reduction, aesthetics, and other benefits provided for each tree species based on its size. Based on these factors, STRATUM was used to assess the "value" of the trees that would be removed (impacts) and the "value" of the new trees at planting and after 5 and 20 years of growth (benefits). The results of the tree assessment and STRATUM computer application are located in Attachment A and summarized in Table 5.

Based on STRATUM's analysis, the existing 264 trees proposed for removal provide an estimated $29,438 in annual benefits. This total represents gross benefits, as the costs associated with tree maintenance activities were not considered. The most important benefits are in the areas of aesthetics ($22,866) and energy conservation ($4,993). The existing trees have a negative effect on air quality due to the emission of biogenic volatile organic compounds.

At planting, the 521 new trees identified in the proposed landscape plans would provide an estimated $22,986 in annual benefits. This total is almost entirely due to aesthetic and other benefits, rather than environmental services such as energy savings. As the trees mature, however, the value of their annual benefits increases to $33,193 at 5 years and $40,700 at 20 years. At both time periods, the most important benefits are associated with aesthetic factors and energy conservation.

The values at 5 and 20 years include an assumed tree survival factor of about 96%, that is, about three to four trees of every 100 trees planted are assumed to die each year over the lifetime of the project (and would not be replaced). This is probably a conservative assumption (i.e., the survival factor would probably be greater) because some trees would be replaced over the life of the project (including those covered by any warranty during the first year of growth). A similar percentage of existing trees—or more likely a higher percentage because of their age and condition—would die during the 5- and 20-year time periods if not removed as part of the project.

Table 5. STRATUM Results. Summary of Annual Benefits: Existing Trees & Proposed NewTrees at Planting, 5 years & 20 years, Lake Merritt Area. Oakland CA.

	No. Of Trees	Annual benefits ($)					
		Energy savings	CO2 removal	Air quality	Storm-water runoff	Aesthe-tic/ other	Total
Existing trees	264	4,993	536	-546	1,590	22,866	29,438
New trees....							
at planting	521	575	44	-75	118	22,324	22,986
at 5 years	500	2,596	188	-191	491	30,109	33,193
at 20 years	450	7,206	632	-80	1,718	31,224	40,700

Evaluation of Project Impacts

Appropriate tree retention develops a practical match between the location and intensity of construction activities and the quality and health of trees. The results of the general and individual tree surveys were the reference points for tree condition and quality. The following plans were provided for each of the four project areas:

- **12th Street Reconstruction.** Site plan. Plans indicated the proposed improvements within the project area including realigned roads and new parking lot configuration. Limits of grading were not provided. Tree trunks were located. Canopy outlines were not included.

- **Boat House.** Site plan prepared by Wallace, Roberts & Todd (March 2006). Plans indicated the proposed improvements within the project area including new entry and other landscape improvements. Limits of grading were not provided. Tree trunks were not located; canopy outlines were representational.

- **Channel area.** Preliminary Tree Inventory prepared by Golden Associates (undated). Plans indicated the location and proposed action for each tree. Grading information was not included on this plan. Tree trunks were not located; canopies were representational.

- **Lakeshore.** Site plan prepared by Wallace, Roberts & Todd (March 2006). Plan indicated the proposed landscape improvements. Limits of grading were not provided. Tree trunks were not located; canopy outlines were representational.

Impacts to trees could occur in a variety of ways. First, demolition of existing infrastructure such as retaining wall, roads, overcrossings, structures and pavement may directly damage tree roots and crowns. Grading and other construction activities may also damage trees, through both direct mechanical injury and indirectly by altering drainage. Finally, landscape renovations may also damage trees.

- **12th Street Reconstruction.** The existing streetscape for 12th and 14th Streets would be completely demolished and reconstructed. The lake edge would be relocated further west. Existing streets would be combined into one thoroughfare. As a result, the parking lot for the Kaiser Auditorium would be narrowed and reconfigured. This section of the project essentially removes all existing infrastructure between the current lake edge and the middle of the Kaiser Auditorium parking lot. As a result, all trees within this area would be removed.

  In addition, the north side of the channel in the area south of the Auditorium would be re-graded and enlarged. The existing steep slope near the edge of the bank would be removed, necessitating removal of the row of coast redwood, California incense cedar and Monterey pines trees.

  Based on my assessment of project plans, only Washington hawthorn #1 appeared to be outside areas proposed for construction. All others trees would be impacted by the project.

- **Boat House.** The project involves renovation of the structure itself, and improvement of the access and utilities associated with it. The retaining wall at the edge of the lake would be removed and replaced. A new pedestrian entry would be created by directly linking the Boat House to Lakeside Drive. Access to a new parking area from Lakeside Drive would be constructed. All trees in the area would be impacted by the project.

- **Channel area.** The most significant impacts arise from two sources. First, the existing shoreline would be increased in area and re-graded. Second, the overcrossing at 7th and 10th Streets would be demolished and reconstructed. As a result, any trees in proximity to these changes would be significantly impacted.

  All of the trees surveyed in the Channel area would be impacted by construction.

- No major development activities were planned for the **Lakeshore Avenue** section of the project.

Impacts from the proposed projects were assessed for each tree (Table 6).

Table 6. Evaluation of Project Impacts. Lake Merritt Area. Oakland CA.

Tree No.	Species	Impacts?	Relation to Project
12th Street			
1	Washington hawthorn	--	Outside graded area?
2	Monterey pine	Impacted by project; poor condition	Within graded area; new street

Exhibit 6b: City of Oakland Measure DD Implentation Project Final Environmental Impact Report, adopted February 13, 2008

Recommendations for Action

All 269 trees surveyed had been identified for removal by the City of Oakland. It is for this reason that they were selected for additional evaluation. With few exceptions, I concur with the City's recommendations.

In developing recommendations for action for each tree, I considered the following:

- **Health & structural condition.** Ninety (90) trees were in poor condition or dead. I do not believe that any trees in poor condition could be restored. Among trees in fair condition, most possessed some significant defect in structure such as poor form and/or crown structure, a history of branch failure and dieback of twigs and branches.

- **Potential for relocation.** I identified three trees with good potential for relocation (coast live oak #80, Canary Island pine #146 and flowering cherry #35ee). Another 30 trees had moderate potential for relocation. Within this group of 30, 15 were Protected trees, mostly flowering cherries at the Kaiser Convention Center parking lot. The clear message from this analysis: the vast majority of surveyed trees were not suitable for relocation.

- **Impacts from construction.** The relationship of each tree to proposed development was evaluated using site plans. For the 12th Street, Boat House and Channel project areas, only two trees are outside areas proposed for grading and construction.

- **Risk.** The potential for each tree to fail and cause damage to property or injure a person was evaluated on a scale from 3 to 12, where 3 indicated low risk and 12 very high. Based on my evaluation, I recommend removal of all trees with risk ratings of 8 or greater in the next 12 months.

Using the four factors noted above, I developed recommendations for action for each tree and project area (Table 7).

12th Street Reconstruction

I recommend that coast live oak #80 be considered for relocation. It is in good condition, semi-mature in development and a species that can be successfully relocated.

Associated with this area of the project is re-grading and re-construction of the north side of the channel, south of the Auditorium. I recommend that grading limits be re-designed to remain outside the dripline trident maple #258. This tree is in good condition and an unusual species for the area.

In addition, I recommend that the proposed planters in the new parking lot be re-located to accommodate existing trees, southern magnolia #121 and #127. Both trees are in good condition. Because the new parking lot would be constructed at existing grade, it should be possible to retain these trees in their existing location.

I do not recommend relocation of ginkgo #211 and Canary Island pine #146. The ginkgo, while in good overall condition, has two significant defects in structure: 1) lacks a central leader in the upper crown and 2) mechanical wounds at the base of the trunk. Although I assessed the pine as having good suitability for preservation, I cannot recommend relocation. I consider this tree too large to relocate. In my view, the cost of this operation would be better spent in maintaining newly planted trees.

Boat House

I concur with the proposed removal of 21 trees in this area. All are located within areas proposed for grading and construction. The only tree in good condition, willow #25, is located within the proposed access driveway to Lakeside Drive. Given its mature condition, I cannot recommend either re-designing the entry to accommodate it or relocating elsewhere on-site.

Monterey pine #42a is a 43" tree in fair condition, located at the east end of the parking lot access to Lakeside Dr. It is overmature in development with a significant number of dead branches in the crown. Given its age, condition and the poor response of this species to construction, I cannot recommend retention.

Channel

I concur with recommendations to remove the 59 trees in the Channel project area. While most are in fair or good condition, either their proximity to infrastructure such as overcrossings and/or location within areas proposed for grading limit opportunities for preservation. In my view, none of the trees proposed for removal warrants the extensive re-design that would be required for their preservation.

Lakeshore Avenue.

I concur with the recommendation for removal of 24 trees and recommend preservation of one; flowering cherry #35ee. This tree is in good condition. A second tree in good condition, fern pine # 111, has displaced the adjacent pavement by 4". The prudent management course would be to remove this 9" tree before additional damage occurs. Given its proximity to infrastructure, the tree cannot be relocated.

Also present are 10 trees in fair condition. Each of these trees possesses some significant defect in structure. For example, California incense cedar #47 is a mature tree with dieback in the upper crown and a one-sided form. Chinese elm #62 has poor crown structure and a history of scaffold branch failure. Blackwood acacia #79 has a strong lean towards the sidewalk, parking and street, and is the process of failing at the base of the trunk. Red flowering gum #110 is in poor overall condition with a history of branch failure and decay at old pruning wounds.

Summary of Proposed Action

I recommend preservation of 5 trees and removal of 264 (Table 6). Included among trees recommended for preservation are the following:

- Coast live oak #80 (12th Street area) is located within areas proposed for grading but could be relocated elsewhere on-site.

- Trident maple #258 (both in 12th Street). Retaining this tree would require revising the proposed grading plan.

- Southern magnolias #121 and #127 are located in parking lot of the Kaiser Auditorium. Their retention would require re-design of the parking area.
- Flowering cherry #35ee is in good condition and outside areas proposed for re-development.

Among the 264 trees recommended for removal are 6 dead trees, 162 that would be impacted beyond their tolerance and 96 in either poor condition or possessing poor structure. Fern pine #111 (Lakeshore) is outside development areas but is recommended for removal due to its conflict with infrastructure.

APPENDIX H

BIOLOGICAL RESOURCES

FRIENDS OF SAUSAL CREEK
TABLE OF REPTILES, AMPHIBIANS, AND MAMMALS
THAT MAY OCCUR IN UPPER SAUSAL CREEK WATERSHED

Amphibians and reptiles of the upper Sausal Creek watershed

Common Name	Scientific Name	Habitat Type	Probability
Amphibians			
California newt	*Taricha torosa*	In or near streams in mixed-hardwood, mixed conifer	Observed
California tiger salamander	*Ambystoma tigrinum californiense*	Grassland/open woodland, requires pools or slow streams for breeding	Low
yellow-eyed salamander	*Ensatina eschscholtzii xanthopicta*	Redwood, other coniferous, mixed chaparral	High
California slender salamander	*Batrachoseps attenuatus*	Frequents nearly all habitat types	Observed
arboreal salamander	*Aneides lugubris*	Coastal live oak woodland, mixed-hardwood, redwood	Observed
western spadefoot	*Scaphiopus hammondii*	Grassland, mixed-hardwood woodlands, washes and floodplains	Low
western toad	*Bufo boreas halophilus*	Most habitats, standing water essential for reproductive success	Medium
Pacific chorus frog	*Hyla regilla*	All habitats but desert	Observed
California red-legged frog	*Rana aurora draytonii*	Highly aquatic, prefers quiet pools of streams and marshes	Low
foothill yellow-legged frog	*Rana boylii*	In or near rocky streams, mixed-hardwood, riparian, coastal scrub	Medium
Bullfrog (introduced)	*Rana catesbiana*	Highly aquatic, quiet waters with thick vegetation	Observed
Reptiles			
western pond turtle	*Clemmys marmorata*	Permanent streams or ponds in a variety of vegetation types	Observed
northwestern fence lizard	*Sceloporus occidentalis occidentalis*	All habitat types	Observed

Amphibians and reptiles of the upper Sausal Creek watershed (cont.)

Common Name	Scientific Name	Habitat Type	Probability
coast horned lizard	*Phrynosoma coronatum*	Open country, especially sandy areas	Low
Skilton skink	*Eumeces skiltonianus skiltonianus*	Early successional stages or open areas in a variety of habitats	Observed
western whiptail	*Cnemidophorus tigris*	Open mixed-hardwood, riparian, chaparral	Low
California alligator lizard	*Gerrhonotus multicarinatus multicarinatus*	Grassland and open canopy stages of riparian, chaparral, woodland.	Alligator lizards have been observed but not identified to species
San Francisco alligator lizard	*Gerrhonotus coeruleus coeruleus*	Grassland, woodland, forested	Alligator lizards have been observed but not identified to species
Pacific rubber boa	*Charina bottae bottae*	Usually found near streams or wet meadows in grassland, hardwood, redwood, riparian habitat	Observed
Pacific ringneck snake	*Diadophus puncatatus amabilis*	Found in open, rocky areas or moist microhabitats in a variety of habitats	Observed
sharp-tailed snake	*Contia tenuis*	Most common where conditions are somewhat moist and surface debris is present	Observed
western yellow-bellied racer	*Coluber constrictor mormon*	Common in open country, avoids densely forested habitat	Low
coachwhip	*Masticophis flagellum*	Open stages of grassland, coastal scrub, chaparral	Low
Alameda whipsnake	*Masticophis lateralis euryxanthus*	Grassland, open stages of coastal scrub and chaparral, riparian	Low
gopher snake	*Pituophis melanoleucus*	All habitat types but prefers open stages	Observed
California kingsnake	*Lampropeltis getulus californiae*	All habitats, most common in upland riparian	Medium

Amphibians and reptiles of the upper Sausal Creek watershed (cont.)

Common Name	Scientific Name	Habitat Type	Probability
California red-sided garter snake	*Thamnophis sirtalis infernalis*	Associated with permanent or semi-permanent water sources in a variety of habitats	High, a number of garter snakes have been observed but not identified to species
Coast garter snake	*Thamnophis elegans terrestris*	Associated with permanent or semi-permanent water sources in a variety of habitats	Observed
Santa Cruz garter snake	*Thamnophis couchii atratus*	A variety of habitats, more aquatic than other garter snakes	Medium, a number of garter snakes have been observed but not identified to species
night snake	*Hypsiglena torquata*	Grassland, chaparral, woodland, in rocky areas or rock outcrops	Medium
northern Pacific rattlesnake	*Crotalus viridis oreganus*	All habitats, prefers rocky outcrops	Observed

Birds of the upper Sausal Creek watershed. List sequence follows the 7th edition of the *American Ornithologists Union Check-List of North American Birds*.

Common Name	Scientific Name	Species Code	Abundance	Presence	Habitat
American white pelican	*Pelecanus erythrorhyncos*	AWPE	R	Cas	
double-crested cormorant	*Phalacrocorax auritus*	DCCO	U	Cas	
great blue heron	*Ardea herodias*	GBHE	U	Cas	
great egret	*Ardea albus*	GREG	U	Cas	
snowy egret	*Egretta thula*	SNEG	U	Cas	
turkey vulture	*Cathartes aura*	TUVU	C	Res	GL, CS, CH
greater white-fronted goose	*Anser albifrons*	GWFG	R	Cas	
Canada goose	*Branta canadensis*	CAGO	U	Cas	
American wigeon	*Anas americana*	AMWI	R	Cas	
mallard	*Anas platyrhychos*	MALL	U	Res	RIP
northern pintail	*Anas acuta*	NOPI	R	Cas	
white-tailed kite	*Elanus leucurus*	WTKI	R	Cas

Key

Abundance	
A:	Abundant
C:	Common
U:	Uncommon
R:	Rare
Presence	
Res:	Year-around resident
Cas:	Sighted occasionally, not known to use the watershed, includes non-breeding migrants
Habitat	
RIP:	Riparian
RF:	Riparian forest
GL:	Grassland
CS:	Coastal scrub
CH:	Chaparral
WL:	Unspecified woodland
OWL:	Oak woodland
MHF:	Mixed hardwood forest
RWF:	Redwood forest
MPF:	Monterey pine forest
EF:	Eucalyptus forest
UR:	Urban

Mammals of the upper Sausal Creek watershed

Common Name	Scientific Name	Habitat	Probability
Virginia opossum	*Didelphis virginiana*	Various, never far from water	Observed
ornate shrew	*Sorex ornatus*	Open areas, grassland, woodland, riparian	Medium
Trowbridge's shrew	*Sorex trowbridgii*	Redwood forest, mixed forest, chaparral	High
vagrant shrew	*Sorex vagrans*	Meadows, moist open areas, riparian	Low
broad-footed mole	*Scapanus latimanus*	Areas with light, sandy soils	Observed
pallid bat	*Antrozous pallidus*	Most common in open dry habitat, but occurs in a wide variety of habitats	Medium
big brown bat	*Eptesicus fuscus*	Chaparral, open areas, open woodlands and forests	Medium
silver-haired bat	*Lasionycteris noctivagans*	Forests	Low
red bat	*Lasiurus borealis*	Forests and woodlands, edge habitat	Low
hoary bat	*Lasiurus cinereus*	Wooded areas, open habitat, habitat mosaics	Medium
California myotis	*Myotis californicus*	Oak woodlands, chaparral, forests	High
long-eared myotis	*Myotis evotis*	Coniferous forests, chaparral	Low
little brown myotis	*Myotis lucifugus*	Riparian, chaparral	Low
fringed myotis	*Myotis thysanodes*	Hardwood and coniferous forests, riparian	High
long-legged myotis	*Myotis volans*	Woodland, forest, chaparral,coastal scrub	High
Yuma myotis	*Myotis yumanensis*	Open forests and woodlands	Medium
western pipistrelle	*Pipistrellus hesperus*	Open, arid areas	Low
Townsend's long-eared bat	*Corynorhinus (Plecotus) townsendii*	Mesic habitat, habitat edges	High

Mammals of the upper Sausal Creek watershed (cont.)

Common Name	Scientific Name	Habitat Type	Probability
western mastiff bat	*Eumops perotis*	Open, arid areas	Low
guano bat (Brazilian free-tailed bat)	*Tadarida brasiliensis*	Grassland, coastal scrub, chaparral, woodland	High
coyote	*Canis latrans*	Open country, ecotones, urban fringes	Observed
gray fox	*Urocyon cinereoargenteus*	Chaparral, forested areas	Observed
red fox	*Vulpes vulpes*	Grassland, coastal scrub, mixed chapparal	Observed
raccoon	*Procyon lotor*	Forest, urban areas, riparian	Observed
striped skunk	*Mephitis mephitis*	Riparian, edge habitat	Observed
spotted skunk	*Spilogale putorius*	Open-mature chaparral, riparian, edge habitat	Medium
long-tailed weasel	*Mustela frenata*	Riparian, open forest, woodland, shrub habitat	High
feral house cat	*Felis catus*	Various	Observed
mountain lion	*Felis concolor*	Riparian, brushy stages of various habitats	Observed
bobcat	*Lynx rufus*	Intermediate stages of riparian and oak habitat, chaparral	Medium
black-tailed deer	*Odocoileus hemionus*	Forests, scrubland, meadows, urban/wildland interface	Observed
California ground squirrel	*Spermophilus beecheyi*	Grazed grasslands	Low
fox squirrel	*Sciurus niger*	Urban/wildland interface, urban parks	Observed
Botta's pocket gopher	*Thomomys bottae*	Light soils, lawns, meadows	Observed
Heerman's kangaroo rat	*Dipodomys heermannii*	Annual grassland, coastal scrub, mixed chaparral	Medium

Mammals of the upper Sausal Creek watershed (cont.)

Common Name	Scientific Name	Habitat Type	Probability
California pocket mouse	*Chaetodipus (Perognathus) californicus*	Grassland/chaparral edges, coastal scrub, hardwood habitats	High
dusky-footed woodrat	*Neotoma fuscipes*	Hardwood forests and scrub, mature chaparral	High
brush mouse	*Peromyscus boylii*	Chaparral, oak and riparian associations	Medium
parasitic mouse	*Peromyscus californicus*	Oak, bay, hardwood woodlands, mature chaparral, coastal scrub	High
deer mouse	*Peromyscus maniculatus*	Forest, coastal scrub, open chaparral, grassland	High
piñon mouse	*Peromyscus truei*	Open woodland and brushy areas	Low
harvest mouse	*Reithrodontomys megalotis*	Grasslands, open chaparral, coastal scrub, riparian	Medium
California meadow vole	*Microtus californicus*	Wet meadows, dense annual grassland	High
house mouse	*Mus musculus*	Houses and nearby, fields, brushy areas	High
brown rat	*Rattus norvegicus*	Near buildings and in wild areas	High
roof rat	*Rattus rattus*	Blackberry thickets, trees, attics	Observed
black-tailed hare	*Lepus californicus*	Shrub habitats with intermediate canopy, open edge habitat	Low
Audubon's cottontail	*Sylvilagus audubonii*	Mature chapparal, coastal scrub, grassland, brush/grassland edges	Medium
brush rabbit	*Sylvilagus bachmani*	Mature costal scrub, chapparal	Observed

I. INTRODUCTION

A. PURPOSE OF THE RESPONSE TO COMMENTS DOCUMENT

This document has been prepared to respond to comments received on the Draft Environmental Impact Report (Draft EIR) prepared for the Measure DD Implementation Project (SCH# 2006122048). The Draft EIR identifies the likely environmental consequences associated with the implementation of the proposed project, and recommends mitigation measures to reduce potentially significant impacts. This Response to Comments (RTC) Document provides responses to comments on the Draft EIR and makes revisions to the Draft EIR, as necessary, in response to these comments or to amplify or clarify material in the Draft EIR.

This RTC Document, together with the Draft EIR, constitutes the Final EIR for the proposed project.

B. ENVIRONMENTAL REVIEW PROCESS

According to CEQA, lead agencies are required to consult with public agencies having jurisdiction over a proposed project and to provide the general public with an opportunity to comment on the Draft EIR.

The City of Oakland circulated a Notice of Preparation (NOP) that included a list of potential environmental effects that could result from the proposed project. The NOP was published on December 8, 2006 and a public scoping meeting was conducted on January 3, 2007. Comments received by the City on the NOP were taken into account during the preparation of the EIR.

The Draft EIR was made available for public review on July 20, 2007 and distributed to applicable local and State agencies. Copies of the Notice of Availability of the Draft EIR (NOA) were mailed to all individuals previously requesting to be notified of the Draft EIR, in addition to those agencies and individuals who received a copy of the NOP. Verbal comments on the Draft EIR were accepted at the City of Oakland Planning Commission meeting held on September 5, 2007.

The CEQA-mandated public comment period for the Draft EIR ended on September 11, 2007. The comment period extended over a 53-day period, about a week longer than the 45-day comment period required by the *California Environmental Quality Act (CEQA) Guidelines*, Section 15105(a). The Copies of all written comments received during the comment period are included in Chapter III of this document.

C. DOCUMENT ORGANIZATION

This RTC Document consists of the following chapters:

- *Chapter I: Introduction.* This chapter discusses the purpose and organization of this RTC Document and the Final EIR, and summarizes the environmental review process for the project.

- *Chapter II: List of Commenting Agencies, Organizations and Individuals.* This chapter contains a list of agencies, organizations, and persons who submitted written comments or spoke at the public comment session on the Draft EIR during the public review period.
- *Chapter III: Comments and Responses.* This chapter contains reproductions of all comment letters received on the Draft EIR as well as a summary of the comments provided at the public comment session. A written response for each CEQA-related comment received during the public review period is provided. Each response is keyed to the preceding comment. It should be noted that many of the comments received do not pertain to the CEQA analysis, but relate to the merits of the project or other issues. While these comments will be included in the record before the decision-makers, the purpose of this document is to respond to CEQA comments and not other issues.
- *Chapter IV: Draft EIR Revisions.* Corrections to the Draft EIR necessary in light of the comments received and responses provided, or necessary to amplify or clarify material in the Draft EIR, are contained in this chapter. Text with underline represents language that has been added to the Draft EIR; text with ~~strikeout~~ has been deleted from the Draft EIR. Revisions to figures are also provided, where appropriate.

II. LIST OF COMMENTING AGENCIES, ORGANIZATIONS AND INDIVIDUALS

This chapter presents a list of letters and comments received during the public review period and it describes the organization of the letters and comments that are included in Chapter III, Comments and Responses, of this document.

A. ORGANIZATION OF COMMENT LETTERS AND RESPONSES

Chapter III includes a reproduction of each letter received on the Draft EIR. The written comments are grouped by the affiliation of the commentor, as follows: State, local and regional agencies (A) and organizations and individuals (B). Verbal comments (C) provided at the Planning Commission meeting held on September 5, 2007 are provided in the order that they were given at the meeting.

The comment letters are numbered consecutively following the A and B designations. Verbal comments are numbered consecutively following the C designations. The letters are annotated in the margin according to the following code:

State, Local and Regional Agencies:	A1-#
Individuals & Organizations:	B1-#
Verbal Comments	C1-#

The letters are numbered and comments within that letter are numbered consecutively after the hyphen.

B. LIST OF AGENCIES, ORGANIZATIONS, AND INDIVIDUALS COMMENTING ON THE DRAFT EIR

The following comment letters were submitted to the City during the public review period and are arranged in order by the date received at the City.

State, Local and Regional Agencies

A1	AC Transit Nancy Skowbo, Deputy General Manager for Service Department	September 10, 2007
A2	Bay Conservation and Development Commission (BCDC) Sara Polgar, Planner	August 27, 2007
A3	Alameda County Flood Control and Water Conservation District County of Alameda Public Works Agency Kwablah Attiogbe, Environmental Services Supervisor	September 10, 2007
A4	East Bay Municipal Utility District (EBMUD)	September 10, 2007

	William Kirkpatrick, Manager of Water Distribution Planning	
A5	East Bay Regional Park District Chris Barton, Senior Planner	September 5, 2007
A6	California Department of Transportation (Caltrans) Timothy Sable, District Branch Chief	September 10, 2007
A7	California Public Utilities Commission (PUC) Kevin Boles, Environmental Specialist	August 31, 2007
A8	United States Coast Guard David H. Sulouff, Chief, Bridge Section	September 7, 2007

Organizations and Individuals

B1	Golden Gate Audubon Society John Bowers, Member, East Bay Conservation Committee	September 7, 2007
B2	California Oaks Foundation Janet Santos Cobb, President	September 10, 2007
B3	Law Offices of Brian Gaffney Matt McFarland	September 7, 2007
B4	Bishop Architecture Ron Bishop, Architect - AIA	September 11, 2007
B5	Ron Bishop	September 5, 2007
B6	Friederike E. Droegemueller	September 19, 2007
B7	John MacHenry	September 11, 2007
B8	Joe Matera Acting President, Essex Homeowners Association	September 11, 2007
B9	David Gill Past President, Lakeside Regency Plaza Homeowners Association	September 11, 2007
B10	David Mix	September 5, 2007
B11	David Mix	September 13, 2007
B12	David Mix	September 11, 2007
B13	Gloria Pieretti	September 10, 2007
B14	Ken Pratt	September 11, 2007
B15	Nancy Rieser	August 5, 2007
B16	Nancy Rieser	September 10, 2007
B17	John Wilson	September 11, 2007
B18	Elise Ackerman	September 11, 2007
B19	Barton Mayhew	September 11, 2007
B20	Catherine McBride	September 11, 2007
B21	Inlandboatmen's Union of the Pacific Marina Secchitano, Vice President	September 5, 2007

B22	Hanson Aggregates Mike Bishop, Marine Operations Manager	September 10, 2007
B23	Gallagher & Burk Materials Division Alan French, General Manager	August 22, 2007
B24	Union Pacific Railroad Company Jeff Asay, Senior Counsel – Western Region	September 10, 2007
B25	Steefel, Levitt & Weiss Shirley E. Jackson	September 14, 2007
C1	Planning Commission Public Hearing Comments	September 5, 2007

III. COMMENTS AND RESPONSES

Written responses to each comment letter received on the Draft EIR are provided in this chapter. Letters received during the public review period on the Draft EIR are provided in their entirety. Each letter is immediately followed by responses keyed to the specific comments. The letters are grouped by the affiliation of the commenting entity as follows: State, local and regional agencies and commissions (A); organizations and individuals (B); and public hearing comments (C).

The reader should note that where text within individual letters is not enumerated, it does not raise environmental issues and does not relate to the information or analysis within the Draft EIR; therefore, no response is required.

MASTER RESPONSE M-1 – PROJECT-RELATED TREE REMOVALS

The City has received comments on the Draft EIR's analysis of the tree removals associated with the implementation of Measure DD-funded activities and has prepared Master Response M-1 to address this issue. Master Response M-1 also provides updated information about events related to three tree removal permits that occurred after the Draft EIR was published. The Master Response includes revisions to the Draft EIR made to disclose these events and to respond to specific comments made on the Draft EIR.

Summary of Events Related to Permits to Remove Trees around Lake Merritt

In June 2002, prior to the passage of Measure DD, the City analyzed the measure's potential environmental effects in an Initial Study that relied upon previous environmental documents prepared by the City. The previous environmental documents included the Oakland General Plan Open Space, Conservation and Recreation (OSCAR) Element Mitigated Negative Declaration, the General Plan Land Use and Transportation Element (LUTE) EIR, the Estuary Policy Plan EIR, and the Coliseum Redevelopment Plan Area EIR. Based on the environmental analysis, the City found that all potentially significant effects would be avoided or mitigated by mitigation measures required by previously prepared CEQA documents. As a result, because none of the circumstances calling for preparation of a subsequent or supplemental EIR were present the City prepared an Addendum to the previous environmental documents.

In December 2005, the City issued three permits for the removal of trees around Lake Merritt. The tree removals are part of the implementation process for the reconstruction of 12th Street and park and street improvements along Lakeshore Avenue, Lakeside Drive and at the Municipal Boathouse. In accordance with CEQA, prior to approving these permits, the City prepared an environmental analysis of the proposed removals, which showed that none of the circumstances calling for preparation of a subsequent or supplemental EIR were present. In August 2006, a lawsuit was filed that challenged the City's granting of the permits. The lawsuit made several arguments against the approval of the permits including that the tree removals would have an aesthetic impact and impacts on biological resources. Further, the lawsuit claimed that the City's environmental review of the permits was inadequate and that additional CEQA documentation should be prepared to address the proposed tree removals. At the time that the Draft EIR for the Measure DD Implementation Project was published in July 2007, the lawsuit was still pending. On October 10, 2007, the Superior Court of California, County of Alameda, upheld the permits, finding that "substantial evidence does not exist in the record to support a fair argument that the issuance of the tree permits may have a significant effect on the environment requiring an EIR be prepared." Thereafter, the City removed some trees around Lake Merritt, including those along Lakeshore Avenue and Lakeside Drive near the Municipal Boathouse pursuant to the permits.

The City issued the Notice of Preparation (NOP) for the Measure DD Implementation Project EIR on December 8, 2006. As some project components had already been planned, designed and funded in reliance upon the 2002 Addendum and prior to the City's decision to prepare this EIR, some components of Measure DD were already constructed or were under construction. These components are described and analyzed in the EIR at a level appropriate to their stage of development when the NOP for the project was issued in December 2006. Included in the Draft EIR is an analysis of the impacts of the project-related tree removals around Lake Merritt and elsewhere. This analysis was included in the EIR because the tree removals had not occurred at the time the NOP was published

and thus the trees were part of the environmental setting against which the impacts of the project were assessed.

Consistent with the City's previous analysis, the Measure DD Implementation Project EIR finds that the tree removals will not have any significant unmitigated environmental effects. Although the removal of some trees has already occurred in accordance with the City's tree removal permit process, the removal does not alter the analysis or findings of this EIR. Subsequent removals associated with the previously issued permits will be performed in accordance with the information and analysis presented in the Measure DD Implementation Project EIR and previous environmental documentation, as have the removals that have already occurred.

In recognition of the Court's ruling upholding the City's CEQA determination on the tree permits and affirming their validity and to reflect the fact that some trees have been removed and others will be removed in accordance with the previously issued permits, and that new trees will be planted in accordance with the previously issued tree permits, the text of the Draft EIR is revised as indicated below. Where appropriate, the revised text includes revisions made in response to specific comments that are addressed elsewhere in the Response to Comments document. Revisions have been made to the Project Description (Chapter III), Biological Resources (Section IV.F), Aesthetic Resources (Section IV.M); and Alternatives (Chapter V).

Project Description (Chapter III)

The text that begins on Page 23 of the Draft EIR is revised as follows:

MEASURE DD BACKGROUND

In November 2002, Oakland voters passed a $198,250,000 bond measure entitled *Oakland Trust for Clean Water, Safe Parks* (Measure DD). This bond measure authorizes funding for physical improvements to existing parks; acquisition of land for new parks; development of new parks and recreation facilities; clean water measures; restoration and rehabilitation of recreation buildings; and implementation of creek and waterway protection and restoration activities.

In June 2002, prior to the passage of Measure DD, the City analyzed the measure's potential environmental effects in an Initial Study that relied upon previous environmental documents prepared by the City. The previous environmental documents included the Oakland General Plan Open Space, Conservation and Recreation (OSCAR) Element Mitigated Negative Declaration, the General Plan Land Use and Transportation Element (LUTE) EIR, the Estuary Policy Plan EIR, and the Coliseum Redevelopment Plan Area EIR. Based on the environmental analysis, the City found that all potentially significant effects would be avoided or mitigated by mitigation measures required by ~~in~~ previously prepared CEQA documents. As a result, because none of the circumstances calling for preparation of a subsequent or supplemental EIR were present, ~~and thus~~ the City prepared an Addendum to the previous environmental documents.

As more defined proposed project components have been identified since the 2002 Addendum, the City has now decided to prepare this EIR to provide a more comprehensive environmental analysis for the Measure DD Implementation Project. As some project components had already been planned, designed and funded in reliance upon the 2002 Addendum and prior to the City's decision to prepare this EIR, some components of Measure DD have already been constructed or are currently under

construction. These components are described and analyzed at a level appropriate to their stage of development when the NOP for the project was issued in December 2006.

~~As of this writing, there is a pending lawsuit that challenges the granting of three permits for tree removal around Lake Merritt, and another CEQA document, the 2006 Lake Merritt Channel Wetlands and Widening Project EIR. The City has not implemented these approvals during the pendecy of the lawsuit.~~ At the time the Draft EIR was published in July 2007, a lawsuit was pending that challenged the granting of three permits for tree removal around Lake Merritt, and another CEQA document, the 2006 Lake Merritt Channel Wetlands and Widening Project EIR. On October 10, 2007 subsequent to the close of the public review period for the Draft EIR, the Superior Court of California, County of Alameda, upheld the tree permits and the City's CEQA determination for the tree permits ruling that "substantial evidence does not exist in the record to support a fair argument that the issuance of the tree permits may have a significant effect on the environment requiring an EIR be prepared." The court also dismissed the challenge to the Channel Wetlands and Widening Project EIR and entered judgment in favor of the City. Thereafter, the City removed some trees around Lake Merritt, including those along Lakeshore Avenue and Lakeside Drive near the Municipal Boathouse pursuant to the permits. None of these removals (nor any other circumstances occurring subsequent to circulation of the Draft EIR) alter the EIR's analysis or conclusions. The EIR acknowledges that the tree removals will occur and new trees will be planted in accordance with the previously issued permits.

The text at the bottom of page 30 of the Draft EIR is revised as follows:

The City is proposing to renovate existing plantings and irrigation around the 12th Street component site. This includes removing approximately 157 existing trees from the median strip along 12th Street, the Kaiser Convention Center parking lot and some areas along the banks of the Lake Merritt Channel and replanting these areas with approximately 321 new trees and other landscaping. The final numbers of trees removed or planted may differ slightly from these counts. Some trees will ~~would~~ be removed because they are in conflict with the new construction, are diseased, have severe structural defects or are fast-growing, short-lived trees reaching the end of their life expectancy. Figure III-3 shows the area where trees are ~~proposed~~ to be removed as part of this project component. As part of the project design process the City hired a certified arborist to evaluate the trees to be removed ~~proposed for removal~~ around Lake Merritt and the Lake Merritt Channel. The arborist recommended preserving four trees in this area by redesigning the project or by relocating some of the trees. The City has incorporated these recommendations into the project. The arborist's report is provided in Appendix I.

The fourth sentence in the last paragraph at the bottom of page 35 of the Draft EIR is revised as follows:

The City will ~~is proposing to~~ remove some existing trees (approximately 58) along the channel as shown in Figure III-5.

The text at the top of page 41 of the Draft EIR is revised as follows:

(2) Lakeshore Avenue Variant B. Lakeshore Avenue Variant B proposes to re-stripe the street to create one travel lane in each direction, a Class 2 bike lane in each direction, a continuous

left-turn lane down Lakeshore Avenue, and parking lanes along both curbs. A planting strip, including street trees, would be included along the park border. A multi-use path would be installed between the planting strip and the park landscaped area. As with Variant A, park landscaping would be renovated ~~and the removal of~~ with some trees removed~~is proposed~~. The surface of the lakeside path would be resurfaced with stabilized decomposed granite and would be widened at the narrow spots. The pedestrian crossing at Cleveland Cascade would be improved and mid-street pedestrian islands would be included at intersections as appropriate. Typical construction activities would include paving, grading, path resurfacing and replanting of landscaping.

The text at the bottom of page 41 of the Draft EIR is revised as follows:

(7) Landscaping Improvements. Approximately 9 acres of existing planting and irrigation are proposed to be renovated along Lakeshore Avenue. This renovation ~~would~~ includes removing approximately 24 existing trees and planting approximately 135 new trees. The final numbers of trees removed or planted may differ slightly from these counts. As part of the project design process the City hired a certified arborist to evaluate the trees to be removed ~~proposed for removal~~ around Lakeshore Avenue. The arborist recommended preserving one tree in this area by relocating it. The City has incorporated this recommendation into the project. The arborist's report is provided in Appendix I. The trees were identified for removal ~~would be removed~~ because they are diseased, have severe structural defects, are crowding buildings, conflict with the new construction or are fast-growing, short-lived trees reaching the end of their life expectancy. Landscaped areas with shrubs and ground cover would replace the existing lawn in narrower parts of the park corridor. This substitution would reduce maintenance and water use and reduce the attractiveness of the area to Canada geese. Hardscape development, including benches and patios, would be added at creek nodes and areas where small peninsulas jut out into the Lake. Figure III-7 shows a proposed landscaping plan, which indicates where trees would be removed and new trees would be planted.

The text at the top of page 47 of the Draft EIR is revised as follows:

Approximately 4 acres of existing planting and irrigation are proposed to be renovated along Lakeside Drive and around the Boathouse. This renovation ~~would~~ includes removing approximately 20 existing trees and planting approximately 65 new trees. The final numbers of trees removed or planted may differ slightly from these counts. The trees were identified for removal ~~would be removed~~ because they are in conflict with the new construction, are diseased, have severe structural defects or are fast-growing, short-lived trees that have reached the end of their life expectancy. Figure III-9 shows the proposed landscape plan, which indicates the locations of ~~where~~ tree removals ~~would be removed~~ and new tree plantings ~~would be planted~~.

Biological Resources (Section IV.F)

The text that begins at the bottom of page 211 of the Draft EIR is revised as follows:

(1) Candidate, Sensitive, or Special-status Species. The only special-status species potentially occurring within all component groups is Cooper's hawk, a California Species of Special Concern. The numerous tall trees throughout the Measure DD Implementation Project area provide nesting habitat for a variety of native bird species, potentially including Cooper's hawk. In addition, some of the creek restoration sites in the upper Oakland watershed may contain suitable nest trees for

sharp-shinned hawk. Both these species are California Species of Special Concern. ~~Proposed t~~Tree removal within the Lake Merritt and the Lake Merritt Channel group area and potential tree removal within other group sites could directly impact nesting Cooper's and sharp-shinned hawks by removing trees that support active nests. Prolonged loud construction noise could also disturb nesting birds, resulting in nesting failure and/or nest abandonment.

Implementation of the City's Standard Conditions of Approval (Condition 32) will reduce potential impacts to nesting Cooper's and sharp-shinned hawks to a less-than-significant level. The pre-construction survey shall be conducted within 15 days prior to the start of work from March 15 though May (since there is higher potential for birds to initiate nesting during this period), and within 30 days prior to the start of work from June through August 15.

The discussion of protected trees in the middle of page 213 of the Draft EIR is revised as follows:

(6) Protected Trees. Based on current plans, the Lake Merritt and Lake Merritt Channel group includes removal of ~~proposes to remove~~ a number of ~~protected~~ trees protected under the City's Tree Ordinance. Protected trees might also be removed as part of the Waterfront Trail, Recreational Facilities, and City-wide Creeks groups. This impact is discussed in Section IV.F2c.

The discussion of protected trees beginning on page 218 of the Draft EIR is revised as follows:

(6) Protected Trees. In order to create additional parkland along the south shore of Lake Merritt and make other improvements around the Lake, approximately 259 trees, including 129 protected trees, are to ~~would~~ be removed and 521 new trees and other landscaping are to ~~would~~ be installed to replace them. Approximately 510 existing trees will ~~would~~ be retained. Overall, the trees will ~~would~~ be replaced at about a 2:1 ratio, that is, two trees will ~~would~~ be planted for each tree removed. Table IV.F-3 summarizes the ~~proposed~~ tree removals and new plantings by project component within the Lake Merritt and Lake Merritt Channel project group. As part of the project design process the City engaged a certified arborist to evaluate the trees to be removed ~~proposed for removal~~ in this group. The arborist recommended preserving five trees by redesigning the project or by relocating some of the trees. The City has incorporated these recommendations into the project and the numbers in Table IV.F-3 reflect the preservation of these trees. The arborist's report is provided in Appendix I.

Table IV.F-3: ~~Proposed~~ Tree Removals for the Lake Merritt and Lake Merritt Channel Project Group

Project Component	Trees to be Retained[a]	Trees to be Removed ~~Proposed for Removal~~	Protected Trees to be Removed ~~Proposed for Removal~~	New Trees to be Planted	Ratio of Trees Planted to Trees Removed
Lakeside Drive/Municipal Boathouse	30	20	17	65	3.25
Lakeshore Avenue/El Embarcadero	90	24	6	135	5.4
12th Street Reconstruction	50	157	90	321	2.0
Lake Merritt Channel	340	58	16	0[b]	0
TOTAL	**510**	**259**	**129[c]**	**521**	**2.0**

[a] Numbers of trees are approximate. Totals include trees recommended for preservation or relocation by the certified arborist.

[b] No new trees will ~~would~~ be planted along the Channel because the habitat type would be converted from landscaped urban parkland to wetlands and open water.
[c] Includes eight protected oak trees.
Source: HortScience, 2007.

The City of Oakland's Tree Preservation and Removal Ordinance (OMC Chapter 12.36) requires a permit for removal of protected trees. A permit is also required if work might damage or destroy protected trees. The project will ~~would~~ comply with the Tree Preservation and Removal Ordinance and ~~would~~ obtain permits for the removal of any protected trees. In addition, the City considers other factors in determining significance for purposes of CEQA including: the number, type, size, location and condition of the protected trees to be removed and/or impacted by construction and the protected trees to remain, with special consideration given to native trees, as discussed below.

The majority of protected trees to be removed are located in the 12th Street reconstruction area. Although protected trees are present in this area many of the trees are in poor or fair condition (see Appendix I); are in the landscaped median strip for 12th Street that is accessible only via rarely used pedestrian underpasses; or are in small planting strips within the parking lot for the Kaiser Convention Center (see Figure III-3). Most of the trees are non-native ornamental species. When the project components around Lake Merritt are looked at as a whole, about twice as many trees are retained in the project area as are to ~~would~~ be removed and approximately two trees will ~~would~~ be planted for each tree removed. The new trees in the 12th Street reconstruction area will ~~would~~ be part of proposed landscaped areas that would have direct pedestrian access to Lake Merritt and surrounding civic buildings. The four components of Group 1 (Lakeside Drive/Municipal Boathouse, Lakeshore Avenue/El Embarcadero, and Lake Merritt Channel) either retain more trees than they ~~would~~ remove and/or plant at least twice as many new trees as are ~~would be~~ removed (Lakeside Drive/Municipal Boathouse, Lakeshore Avenue/El Embarcadero, and 12th Street Reconstruction). Eight trees to be removed are protected native oak trees.

The project would not fundamentally conflict with the City of Oakland's Tree Preservation and Removal Ordinance and would therefore be a less-than-significant impact for the following reasons: approximately twice as many trees will ~~would~~ be retained as will ~~would~~ be removed; removed trees will ~~would~~ be replaced at approximately a 2:1 ratio; the majority of trees to be removed are in poor or fair condition; and many are located in a parking lot or an inaccessible median strip. In addition, because trees are being replaced at approximately a 2:1 ratio many benefits lost by the removal of trees, such as aesthetics, energy conservation, reductions in stormwater runoff, improvements in air quality, and capture of carbon dioxide (a greenhouse gas) will ~~would~~ be compensated for in a few years because of the large number of new trees being planted. The impacts of removing trees and the benefits of planting new trees in the Lake Merritt and Lake Merritt Channel group were estimated quantitatively using a computer application developed by scientists at the United States Department of Agriculture (USDA) Forest Service's Pacific Southwest Research Station to assess populations of street trees.[1] The results of this study are provided in Appendix I. Because the City would comply with the Tree Preservation and Removal Ordinance, the Lake Merritt and Lake Merritt Channel project components would have a less-than-significant impact. To reach this conclusion, the City considered the number, type, size, location and condition of the protected trees to be removed and/or impacted by construction and the protected trees to remain, including native trees.

[1] USDA Forest Service. http://www.itreetools.org/street_trees/introduction_step1.shtm.

A small number of protected trees may require removal as part of the Waterfront Trail, Recreational Facilities, City-wide Creeks groups or other components of the Lake Merritt group (e.g., the Cleveland Cascade). The trees would be replaced in accordance with the City's Tree Protection Ordinance and Standard Conditions of Approval (Condition 32), which would reduce the impact to a less-than-significant level.

Aesthetic Resources (Section IV.M)

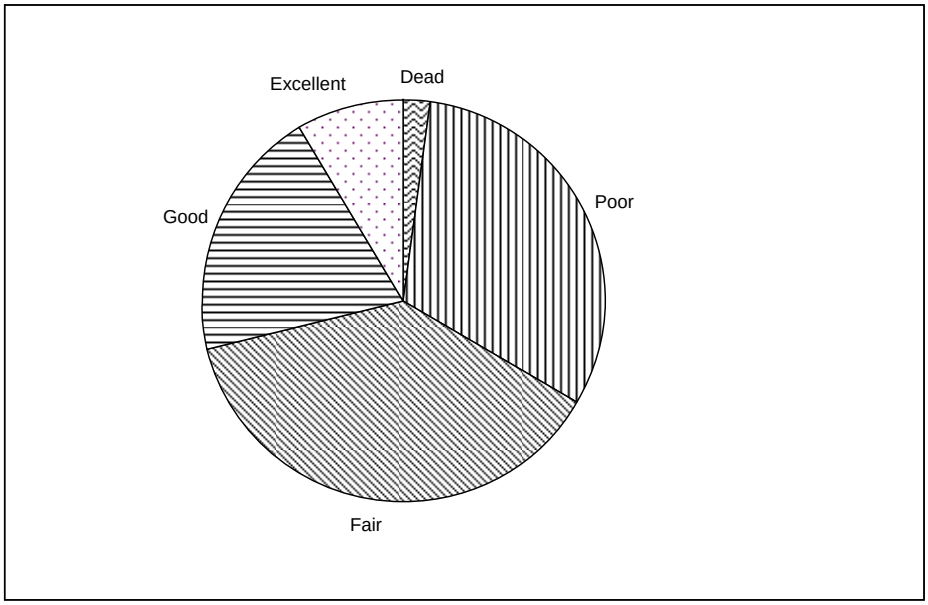
Page 336 of the Draft EIR is revised as follows:

Lake Merritt and Lake Merritt Channel (Group 1). Lake Merritt and the Lake Merritt Channel are resources that are part of scenic vistas seen from numerous locations in Oakland, including the City's Downtown and hillside areas. The proposed project would result in beneficial impacts to the visual quality of the Lake through water quality control measures, the restoration of historic buildings and monuments around the perimeter of the Lake, and enhanced landscaping. These changes to the Lake and the Channel would result in small but beneficial improvements to scenic vistas encompassing these waterways. ~~The project would result in the r~~Removal of certain ~~diseased~~ trees from the vicinity of the Lake is consistent with and in furtherance of the project.~~;~~ The removal of these trees will enhance the visual character of the Lake and ~~; however, the removal of these trees~~ will ~~would~~ not substantially adversely change scenic vistas. New trees will ~~would~~ be planted to replace the trees that are removed, and these trees will not substantially block scenic vistas. No structures would be built that would block surroundings and would not block scenic views of the Estuary. Therefore, this group of project components would have a less-than-significant impact on scenic vistas.

Page 341 of the Draft EIR is revised as follows:

Lake Merritt and Lake Merritt Channel (Group 1). A key component of this group is the various proposed water quality control measures, including the installation of devices and features to clean and circulate water, and the creation of an open channel to allow for increased tidal flow into and out of the Lake. These measures, by improving water quality in the Lake, would enhance the scenic qualities of the waterway (including portions of the Lake visible from I-580), which suffers from algal blooms and stagnation associated with a surplus of nutrient-rich pollution. In addition, this group would involve the renovation of existing landscaping, which would improve the landscape context of the Lake. ~~As part of the project, certain trees would be removed (and replaced with healthy individuals).~~ Based on the Tree Assessment prepared by HortScience, Inc. (Appendix I), of the 269 trees that will be removed as part of the project, 6 are dead, 84 are in poor condition, 101 are in fair condition, 55 trees are in good condition, and 23 trees are in excellent condition (see Chart IV.M-1). As shown in Chart IV.M-1, ~~M~~many of the trees considered for removal ~~that would be removed~~ are diseased, short-lived, or are not stable (i.e., they are dead, or in poor to fair condition). Although some of the trees subject to removal may ~~that would be removed~~ contribute or may have contributed to the scenic quality or overall visual character of the Lake, this contribution is not significant either individually or cumulatively. In context, approximately 500 trees will be retained in the project area and 521 trees will be planted as part of the project (a replacement ratio of almost two trees for every removed tree). These replacement trees will fill in any visual "gaps" created by the removed trees. As shown in Figures IV.M-1 through IV.M-4, the removal of trees from the site will not adversely affect scenic resources or visual character as seen from key viewpoints around Lake Merritt.

Chart IV.M-1: Tree Condition and Frequency of Occurrence



Source: HortScience, Inc., 2007.

This conclusion is also supported by a cost/benefits analysis of tree removal/replacement conducted by HortScience as part of the Tree Assessment. Using a model that takes into account the environmental and economic benefits of trees (including improvement of visual quality, reductions in storm water runoff, improvements in air quality, and sequestration of carbon dioxide), HortScience determined that the trees subject to removal from the site provide an estimated $29,438 in annual benefits, approximately 77 percent of which ($22,866) is associated with aesthetic value. At planting, the 521 replacement trees will provide an estimated $22,986 in annual benefits, "almost entirely due to aesthetic and other benefits." As the trees mature, the value of their annual benefits will increase to $33,193 at 5 years and $40,700 at 20 years. Therefore, based on the model, within only 5 years of planting, the replacement trees will be more valuable in terms of aesthetics and other environmental/ economic benefits than the existing trees that will be removed as part of the project. Although there are limitations with assigning monetary values to resources like trees (i.e., resource valuation generally lacks a reliable way to estimate the value of ecological damage), the data produced by HortScience suggest that the aesthetic costs of tree removal do not outweigh the benefits of tree replacement. Based on the HortScience analysis, and an understanding of tree removal in the context of trees that will be preserved and trees that will be replaced as part of the project, ~~Therefore,~~ the removal of select trees and the replacement with new individuals would not be considered a significant impact to scenic resources or the visual character of the project site.

Page 342 of the Draft EIR is revised as follows:

Lake Merritt and Lake Merritt Channel (Group 1). Lake Merritt and its surroundings are characterized by a semi-formal landscape of rolling lawns and walkways, all oriented around the water body itself. While the area has high visual quality, the aesthetics of the area are diminished

primarily by low water quality in the Lake, landscaping and trees that are in poor condition, and roadways surrounding the Lake that are disproportionately wide and emphasize automobile traffic at the expense of the pedestrian environment. The proposed project would substantially improve these adverse conditions. First, the removal of the 12th Street culvert and the implementation of the various water quality control measures would improve the water quality of the Lake, and enhance the potential for the growth of native vegetation and use of the water body by native wildlife (besides Canada geese). Second, landscaping and trees in poor condition will ~~would~~ be removed and replaced with new plants that would enhance the visual environment. Third, several roadways (including 12th Street, Lakeshore Avenue, and Lakeside Drive) would be reconfigured and/or narrowed to include bike lanes and pedestrian paths. These changes would reduce the visual intrusion of motor vehicles and would improve the visual environment for the bikers and walkers that comprise the key users of Lake Merritt. Lastly, historic buildings around the Lake, some of which are in poor condition, would be rehabilitated. At the Municipal Boathouse, two parking lots next to the Lake and Boathouse would be removed and replaced with landscaping, terraces, and pathways. A smaller parking lot would be constructed closer to the road and the remaining parking would be relocated along Lakeside Drive itself. The improvement and preservation of historic structures, and the modification of parking areas would benefit the visual quality of the area, including the lakeshore itself. Therefore, the project group would have a less-than-significant impact on the existing visual character of the area surrounding the Lake and Lake Merritt Channel.

Alternatives (Chapter V)

The third paragraph of Section V.D on page 352 of the Draft EIR, is revised as follows:

For Group 1, the No Project alternative would include completion of the Pergola, Children's Fairyland, the E. 18th Street Pier, and Municipal Boathouse renovations. However, paths, landscape improvements and additional patron parking (for the Boathouse) that would provide improved access to the facilities would generally not be constructed. The land around Lake Merritt would continue to be used as park land. Landscape maintenance, including the removal and replacement old or diseased trees, would continue as needed. Trees will be removed along Lakeshore Avenue, Lakeside Drive and the 12th Street reconstruction area in accordance with the permits for the removal of trees previously issued by the City. ~~The tree replacement process would generally maintain the current appearance of the park, but no substantial increase in landscaped area or number of trees is likely to occur because there would be no net increase in parkland as would occur if the project were constructed as proposed.~~ The creation of bike lanes by restriping Lakeside Drive and Lakeshore Avenue might occur as part of other projects, but associated landscaping and pedestrian path improvements would not be constructed.

Table V-1 on page 353 of the Draft EIR, is revised as follows:

Table V-1: No Project Alternative (Groups 1 and 2): Components Completed or In Progress and Components Unbuilt

Lake Merritt and Lake Merritt Channel (Group 1)
Components Completed or In-Progress • Pergola Renovation (complete) • Installation of a Fire Protection Main (complete) • Water Quality Improvements, including storm drain filters at Bellevue/Staten, 27th/Valdez, and 22nd/Valley; pilot air diffuser project; new aeration fountain; Pergola fountain (complete) • Children's Fairyland Renovations (in-progress) • Municipal Boathouse Renovation (in-progress) • E. 18th Street Pier Improvements (in-progress) • Tree removals along Lakeshore Avenue and Lakeside Drive **Unbuilt Components** • 12th Street Improvements • Lake Merritt Channel • Lakeshore Avenue~~,~~ and El Embarcadero~~, and E. 18th Street Pier Improvements~~ • Lakeside Drive • Snow Park and Lakeside-Harrison-20th Street Intersection • Bellevue Avenue Redesign • Sailboat House • All water quality improvements except those noted above
Oakland Waterfront Trail (Group 2)
Components Completed or In-Progress • Union Point Park • Park Street Triangle traffic study • Alameda Avenue south of Fruitvale Avenue • 66th Avenue Gateway **Unbuilt Components** • Estuary Park • 10th Avenue Marina • Brooklyn Basin • Brooklyn Basin to Embarcadero Cove • Livingston Pier • Cryer Site • ConAgra to Park Street Bridge • Bridge boardwalks at Park Street, Fruitvale Avenue and High Street • Derby Avenue to Lancaster Street (Oakland Museum Women's Board warehouse) • ~~Alameda Avenue south of Fruitvale Avenue~~ • US Audio/Capture Technologies and friendly Transportation Trail Connection • Gallagher & Burk/Hanson Aggregate Trail Connection • ~~66th Avenue Gateway~~

The third paragraph of Section V.E.2 on page 356 of the Draft EIR, is revised as follows:

Although the City has a permit for tree removals in the 12th Street reconstruction area, as of this writing, none has been removed. The alternative would reduce the number of trees that will need to ~~would~~ be removed to allow the reconstruction and realignment of 12th Street. In this scenario, the Kaiser Convention Center parking lot would not be reconfigured and therefore the trees located in this area would be preserved. Approximately 59 trees would be preserved, including 12 protected trees (all flowering cherries), in and around the parking area. Trees along the median of the existing 12th

Street alignment would still be removed ~~require removal~~ in order to accommodate the new roadway and modified grade of the park land.

Subject: Draft Environmental Impact Report (EIR) for the Measure DD Implementation Project

To Whom It May Concern:

Thank you for the opportunity to comment on the Draft EIR on the Measure DD Implementation Project. We applaud the City's efforts to use this voter-approved funding source to rebuild and renew Lake Merritt and Oakland's park and recreation infrastructure. AC Transit supports the development of multi-use paths around Lake Merritt. AC Transit also supports improvements to the pedestrian realm, within which our passengers walk to and wait for buses. **1**

However, we are seriously concerned about some projected impacts of Measure DD projects. In particular, we are concerned about the potential for Measure DD implementation to significantly degrade bus service to East Oakland via the 12th Street Dam. 12th Street Dam is one of the most critical links in the entire AC Transit system. It would be deeply unfortunate if the environmental benefits of Measure DD projects were undermined by environmental losses from transit.

11th and 12th Street from Martin Luther King Junior Way to 1st Avenue are specifically noted as streets of particular interest to AC Transit in the Transit Streets Cooperative Agreement recently signed by the City and AC Transit. The affected section of Harrison Street is served by line NL, one of the frequent service lines that the **2**

Agreement prioritizes. The Transit Streets Agreement lays out notification and consultation procedures for the City and AC Transit to use on projects affecting major transit corridors. The Agreement embodies and anticipates a spirit of collaboration and cooperation between the City and AC Transit. The 12th Street corridor is also discussed in the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the East Bay Bus Rapid Transit Project.

Letter
A1
cont.

AC Transit has had ongoing and constructive discussions with the Public Works Department about impacts of and mitigations for the 12th Street roadway reconstruction project. We believe that the plans developed for the long construction period of the project have substantially responded to AC Transit concerns. **2 cont.**

The Measure DD Project and AC Transit's Concerns

Measure DD is a $198 million bond passed by the voters of Oakland in 2002. Measure DD provided funds for park, recreation and open space projects throughout Oakland, with an emphasis on the Lake Merritt and Oakland waterfront areas. It also provides funds to develop a park in the former 9th Avenue Terminal area, the area where the Oak to 9th Project has been approved (pending legal actions). **3**

The project that is most significant to AC Transit involves the substantial narrowing of the roadway across Lake Merritt on the 12th St. Dam. A roadway that now provides six lanes in each direction would be reduced to three lanes in each direction. The existing roadway would be eliminated and a new roadway constructed somewhat farther from the Lake. We understand the City's desire to reduce the large amount of roadway in that area, but this must be balanced with the need to maintain viable transit operations. **4**

We are also concerned about projects that would take place in the area of 20th & Harrison Street which would cause delays to bus service in that important service area. **5**

12th Street Dam Roadway

Projected Travel Time Impact of Measure DD Project on 12th St.

In our letter concerning the Notice of Preparation (NOP) for this EIR, AC Transit stated "The EIR should analyze the likely impact of roadway changes on bus speeds during both the construction period and with the final configuration." The EIR includes information about existing travel time and projected change in vehicle travel time across the 12th St. dam in Tables IV.C-4, Tables IV.C-6, and Table IV.C-8. We appreciate the City of Oakland's responsiveness to our request. We have summarized the data in the table on Page 6 of this letter. **6**

However, the stated increases in travel time may underestimate the actual delay for buses. To the extent that buses need to pull into and out of traffic flow for stops, their travel time could be greater. However, the projected increases in travel time are for travel from Madison St. to Foothill Boulevard. Since some buses would leave this route at International Boulevard, increases in travel time could be smaller.

The travel time projections are presented as summary estimates for a roadway segment. It would be helpful if the methodology to develop these projections was discussed further and if the projections were also presented in more disaggregated form. It would also be helpful if midday delay estimates were provided. That would **7**

Letter
A1
cont.

allow us to more precisely estimate the potential impact of traffic delays on AC Transit operations and costs. **7 cont.**

Transit Service across 12th St. Dam—Current and Planned

The importance of the 12th Street roadway to the AC Transit system is hard to overstate. The 12th St. Dam has the second highest volume of AC Transit buses of any roadway in Oakland (after Broadway downtown). Six bus lines use this route; they are the1 International, the 1R International Rapid, 13 Lakeshore, 14 San Antonio, 18 Park, and 40 Foothill. The 1, 1R, 18 and 40 are among the busiest and most important routes in the AC Transit system. The six lines using 12th St. form the majority of the nine bus lines that connect East Oakland to Downtown Oakland. A seventh line to East Oakland, the NL, would be affected by the proposed Harrison Street project. In the peak hour, there are 54 buses traveling across 12th Street dam, nearly one bus per minute. **8**

If the proposed Bus Rapid Transit (BRT) line on International Boulevard is developed, it will use 12th Street and bus service on the route will increase further. BRT is planned to have very high frequency operations, perhaps as high as one bus in each direction every five minutes.

Significance of Delay on 12th St. Dam

Increased delay on 12th Street has an impact to AC Transit operations. It becomes more difficult and costly to provide the same bus service. If AC Transit's operating budget is constrained, delay can make it necessary to reduce service. However, delay also has an impact on the passengers using AC Transit, the automobile drivers who benefit from AC Transit passengers not driving, and to the City of Oakland's efforts to increase transit mode share and support transit.

We wish to stress that the projected 2-3 minute delays across 12th St. Dam are highly significant. Operationally, AC Transit often makes substantial efforts to reduce delay at a given location by as little as 15-30 seconds, so 194 seconds is a major impact. From the passenger's perspective, the average travel time on an AC Transit bus is 15-20 minutes, so a 2-3 minute delay creates a 10-20% increase in travel time. We doubt that most automobile drivers would regard analogous increases in travel times as unimportant. **9**

Increased Cost of Operations

AC Transit's full operating cost is $131 per hour of operation, so each minute of delay contributes to that cost. If it becomes necessary to operate additional buses to maintain the schedule, this would cost $250,000-$300,000 per year with no improvement in service (this might be described as running harder and harder to stay in the same place). Many AC Transit routes are tightly scheduled, with the minimum feasible running time and layover time at the end, so 2-3 minutes could force the addition of another bus. If delay on just two of the routes required the addition of one **10**

Letter
A1
cont.

bus apiece, the increased operating cost would be some $600,000 per year, in addition to increased operating costs incurred on the other four lines.

The information in the EIR is not sufficient to develop a precise estimate of the cost of the delay projected on the 12th St. roadway. The EIR does not include estimates of the delay at midday, on weekends, or at other times besides the peak. **10 cont.**

Aggregate Travel Time Impact with Other Projects Affecting the Same Bus Routes
The EIR also does not address the potential for aggregate impacts on the same bus routes as Measure DD projects. We asked for this information in our letter about the Notice of Preparation. Road narrowing or other projects elsewhere could delay the same bus routes as Measure DD, causing aggregate delays. We are concerned about this potential for all routes, but particularly for the 40 Foothill route. AC Transit service on Foothill Boulevard has already been delayed due to reduction in travel lanes on that street. We understand that the City is considering further narrowing of Foothill Boulevard, which could cause aggregate delays with this project. Potential aggregate impacts should be identified and addressed. **11**

Degradation of Service to Passengers
The impact on bus passengers is just as important as the impact on AC Transit. Bus passengers' trips would take longer. Some trips could become impossible, for example, buses might miss transfer connections that they would have otherwise have made. **12**

Degradation of the primary bus corridor to East Oakland also raises environmental justice issues. Passengers on these routes are overwhelmingly non-White and many are low income. It appears that they would absorb a disproportionate impact from improvements around Lake Merritt designed to benefit the city population as a whole. While auto drivers who now use 12th Street could seek routes that did not use the Dam, most transit passengers would not have this option. **13**

Degradation of bus service would also be inconsistent with Oakland's planning policies. Oakland has declared itself a "Transit First" city, pledging to prioritize improvements to transit. The Land Use and Transportation Element of Oakland's General Plan declares that the City should encourage transit and expedite the movement of transit vehicles. **14**

The City's policies would be especially undermined if passengers shifted from using the bus to driving alone. Close to 40% of AC Transit passengers had a vehicle available for trips they took on transit. Thus there is the potential for mode shifts in a negative direction. **15**

Letter
A1

Travel time impacts as CEQA Impacts

Although the language is somewhat ambiguous, the EIR seems to argue that the substantial delays in travel time it envisions should not be viewed as an impact under the California Environmental Quality Act (CEQA).

> "The City studied the 12th Street and Harrison Street corridors to understand how the project would affect traffic travel times in these areas, although the City does not have CEQA significance criteria for roadway delays because it believes that intersection analyses more accurately predict traffic impacts. Because traffic patterns change in response to traffic delays, the City believes that traffic impacts are better modeled by an intersection analysis for determining significance under CEQA. The travel time analysis was nevertheless performed to help understand how automobile, bus, and other traffic along these streets would be affected by the Lake Merritt and Lake Merritt Channel project components" (p.129).

16

AC Transit does not accept that view, at least with regard to bus travel. Instead, we believe that the delay in travel time is the primary impact on transit operations and passengers of this and other projects. Operational efficiency and passenger experience is affected by the overall ride more than the individual intersection. Travel time determines the cost of operation and the bus' competitiveness with other modes.

The EIR also argues that traffic patterns change in response to traffic delays. While this may be true for automobile drivers, buses generally cannot change routes in response to delays (we discuss this difficulty in Designing With Transit, p.5-6). Passengers expect the bus to operate on its designated route, even if that route has been made slower.

17

The City also considers a project which negatively impacts "alternative transportation" (such as bus transit) to have a CEQA impact. By imposing delays on large numbers of buses, this project would negatively impact alternative transportation.

18

Travel time delays, especially delays as large as those projected in this EIR, should be acknowledged as potentially significant negative impacts under CEQA and should be properly mitigated.

Potential Mitigations to Travel Time Impacts

The Value and Limitations of Transit Signal Priority

The EIR proposes (pp. 133 and 139) that transit signal priority be used along 12th Street to reduce AC Transit travel times. The EIR notes that "This action would reduce delays for AC Transit but would not completely eliminate increases in travel time along 12th Street and Harrison St.

AC Transit requested the use of transit signal priority in our NOP letter. We support signal priority on both corridors and believe it would be useful in reducing travel time. However, the improvements in travel time caused by transit signal priority would be insufficient to mitigate the level of delay indicated by the EIR for 12th St (Harrison St. is discussed in the last section of the letter).

20

As noted above, the volume of buses on the 12th Street Dam is very high, approaching one per minute (54 per hour) in the peak period. If the traffic signals tried to give

Letter
A1
cont.

priority to each bus, or even a large fraction of the buses on the roadway, the signals would be perpetually off-cycle and would never be able to reset to their normal cycle. Even with an aggressive signal priority protocol, most buses in the peak, when the roadway would presumably be most congested, would not be able to take advantage of it.

In addition, signal priority only reduces delay caused by signals. Signal priority by itself could not reduce delay caused by high traffic volumes and roadway congestion. We have clearly seen this limitation of signal priority in our operation of the San Pablo Avenue Rapid line (line 72R).

20 cont.

Additional Mitigations

Additional mitigations will be required to substantially reduce projected delay to an acceptable level and to mitigate the significant negative environmental impact that the delay in the current plan represents. AC Transit's proposed mitigations represent our best assessment, at this time, of effective mitigation measures. We have also considered how to minimize the effect of needed mitigations on other aspects of the Measure DD project.

AC Transit would be pleased to discuss these and/or other mitigations with the City of Oakland. Our goal is not necessarily to implement these specific mitigations, but rather to ensure that mitigations which would effectively reduce delay are implemented. In our letter on the Notice of Preparation for this EIR, AC Transit proposed these and similar mitigations. The City rejected all of our potential mitigations without providing adequate substitutes. Therefore, we now propose the following measures:

1. "Passive" transit signal priority - This would be in addition to the active signal priority of holding green lights and truncating red lights. In passive signal priority, signals are timed in the appropriate progression for buses rather than private cars. This system is used effectively on Market Street in San Francisco.

2. An Eastbound Bus lane in the 11th St. tunnel access to the roadway, with a dedicated bus signal at end of tunnel. This bus lane would be one of the existing three lanes, presumably the right lane. This approach would allow a bus to go around congestion in the 11th St. tunnel and move out of the tunnel quickly. Our preliminary evaluation is that this lane in the tunnel would obviate the need for a bus lane the full length of the roadway eastbound.

3. Westbound—A bus lane the length of the roadway. In the westbound direction, it does not appear possible to use queue jumps to circumvent congestion. Therefore we propose a dedicated bus lane for the approximately 1/3 mile length of the roadway. The lane should be approximately twelve feet wide. We do not believe that this would be an

21

Letter
A1
cont.

undue intrusion on park and recreational space adjacent to the planned six lane roadway.

4. Elimination of eastern crosswalk at the11th-12th/14th Street intersection The design for the new intersection of 11th Street, 12th Street, and 14th St. incorporates two crosswalks across the east-west roadways. However, the eastern crosswalk has the potential to cause substantial traffic delay, since use of the crosswalk would force all three roadways to stop. The crosswalk provides little pedestrian benefit, since it reaches an inactive, inaccessible area behind the Oakland Museum. The western crosswalk is very close to the eastern crosswalk. Eliminating this crosswalk and redesigning pedestrian paths to connect to the western crosswalk would also reduce the amount of paved surface in the area, which the City has raised as a concern.

21 cont.

As part of the process of developing a plan for effective operation across 12th Street, AC Transit is willing to consider relocation of stops and rerouting of bus lines in the area where useful and feasible.

Harrison Street, 20th Street-Grand Avenue

The impacts of the DD projects on Harrison Street between 20th Street and Grand Avenue present similar issues to those on 12th Street, albeit on a smaller scale. In this area, the City proposes to reconfigure the triangular intersections of Harrison Street, 20th Street, and Lakeside Drive into a single, perpendicular T intersection of Lakeside and Harrison. The number of lanes on Harrison Street would be reduced. We applaud the City's goal of improving access to the Lake in an area where it is currently difficult.

Four all day AC Transit lines operate through this segment; the 11 Oakland Ave., the 12 Grand, the 59 Piedmont, and the NL Macarthur. The NL is a limited stop Transbay trunk line operating every 15 minutes on weekdays, a line which AC Transit is working with the City to convert to Rapid service.

22

Additional delay would result from this project and the cumulative effect of other projects, particularly in the northbound direction. By 2025, northbound buses in the afternoon peak are projected to be delayed almost 1.5 minutes (86 seconds), and one minute in the morning peak (58 seconds).

We are seriously concerned about these delays. In addition, we are concerned about planning for this side of Lake Merritt proceeding in isolation from planning for the Grand-Macarthur Rapid. As noted above, this project would convert the existing NL to faster, more frequent Rapid service. AC Transit and the Alameda Congestion Management Agency developed a preliminary report on this proposal, and AC Transit now has adequate planning funds to develop a detailed plan for this Rapid. There are several outstanding issues in planning this area, such as the configuration of the roadway and the location of bus stops.

Letter
A1
cont.

Planning for the Measure DD project and the Grand-Macarthur Rapid in this area should proceed together. Otherwise, the City runs a very real risk of making costly changes and improvements which would need to be modified or eliminated later. We propose that no plan for Measure DD improvements in this area be finalized until the Grand-Macarthur Rapid plan is finalized.

22 cont.

AC Transit looks forward to continuing to work with the City of Oakland to structure projects which support both recreational and transit needs. If you have any questions about this letter, please contact Nathan Landau at 510-891-4792 or nlandau@actransit.org.

LETTER A1
AC Transit
Nancy Skowbo, Deputy General Manager for Service Development
September 10, 2007

Response A1-1: The introductory statement expresses an opinion on the merits of the project and states that AC Transit supports several elements of the project, including the development of multi-use paths around Lake Merritt and improvements to the pedestrian environment. The transit agency's support for these elements will be considered by City of Oakland decision-makers during review of the merits of the project.

Response A1-2: AC Transit states that it is "concerned about the potential for Measure DD implementation to significantly degrade bus service to East Oakland via the 12th Street Dam." This potential impact of the project is identified in the Draft EIR but is determined to be less than significant for the reasons provided on page 130 of the document. Although the City did not find the impact to be significant, the City nevertheless shares AC Transit's concern. As noted on page 133 of the Draft EIR, the City will continue to work with the agency to find mutually agreeable solutions in the spirit of the Transit Street Cooperative Agreement, which the comment cites as an example of collaboration and cooperation between the City and AC Transit.

The comment concludes by stating that AC Transit has had ongoing and constructive discussions with the City's Public Works Department about impacts and mitigations for the 12th Street roadway reconstruction and believes that the City has largely responded to the agency's concerns about impacts that would occur during the construction phase of the project. The comment does not pertain to the Draft EIR's environmental analysis so not further response is provided.

Response A1-3: The comment incorrectly states that Measure DD would provide funds to develop a park in the former 9th Avenue Terminal area. The park and waterfront trail at the 9th Avenue Terminal would be developed as part of the Oak to 9th Project as indicated in the project description (Figure III-10a, for example) and would be funded by development fees paid by that project. The Measure DD Implementation Project proposes to fund improvements at Estuary Park, which is located on the opposing bank of the Lake Merritt Channel from the Oak to 9th development site.

Response A1-4: Elements of the 12th Street reconstruction that are presented in the Project Description of the Draft EIR are identified, including narrowing of the 12th Street roadway. The comment states that the transit agency understands the City's desire to reduce the large amount of roadway in that area, but that the narrower roadway must be balanced with the need to maintain viable transit operations. The Draft EIR describes and analyzes the potential impacts of the project on transit operations on page 133. The City of Oakland decision-makers will consider these impacts and the opinions of AC Transit on the need to balance the project's impacts and benefits during review of the merits of the project.

Response A1-5: The comment states that AC Transit is concerned about projects that would take place in the area of 20th and Harrison Streets and the impacts that they would cause to bus service in this area. The transportation analysis of the Draft EIR considered the impacts of the project in combination with past, other current and probable near-term projects scheduled to complete by Year 2025, including AC Transit's Bus Rapid Transit improvements. The results of the impact analysis for bus service, including travel times and speeds, in the area around 20th and Harrison Streets are presented on page 139 of the Draft EIR. As the comment does not identify specific impacts that are of concern to the agency, no further response is necessary. Refer to Response to Comment A1-22 for additional information about bus service in the vicinity of 20th and Harrison Streets.

Response A1-6: The comment indicates that the increases in travel time identified in the Draft EIR may underestimate the actual delay for buses to the extent that buses need to pull into and out of traffic flow for stops. The analysis that evaluated travel times along the 12th Street and Harrison Street corridors was performed to help understand how automobile, bus and other traffic along these streets would be affected by the Lake Merritt and Lake Merritt Channel project components. No specific consideration was given to how bus travel time would be affected by the need to pull into and out of traffic flow for stops. The design of bus stops along both corridors would be such that buses would at least partially block the right lane. Re-entry into the flow of traffic should not be a significant problem for AC Transit operations. Variations in the actual travel time for AC Transit vehicles (compared to the results reported in the Draft EIR) would result from bus stop access and from routes that use only part of the routes that were analyzed.

Response A1-7: The methodology for analyzing travel times is described on page 108 of the Draft EIR as the Highway Capacity Manual arterial analysis method. This method is described in detail in the *Highway Capacity Manual* (Transportation Research Board 2000). The projections were presented in more disaggregated form in Appendix E. No analysis was performed for midday traffic conditions because the peak hours coincide with the commuter peaks and the determination of likely effects would be greatest during those peaks. The midday analysis would not inform the determination of significance in the impact analysis and thus was not performed.

Response A1-8: The comment identifies bus lines that currently operate along 12th Street and states that if AC Transit's proposed Bus Rapid Transit system is developed it would also use the 12th Street corridor. The information provided by the comment is included on page 116 of the Draft EIR and was considered in the Draft EIR's analysis. No revisions to the Draft EIR are necessary.

Response A1-9: The Draft EIR discloses that converting 12th Street from a limited access high-speed facility to a mixed mode transportation system that accommodates pedestrian activity around Lake Merritt would result in increased travel times along 12th Street for both autos and transit vehicles. The CEQA impacts of increased delay and decreased LOS at intersections are addressed in the Draft EIR. Although the City

does not have CEQA significance criteria for roadway delays because it finds that LOS intersection analyses more accurately predict traffic impacts, the City studied the corridor to understand how the project would affect traffic travel times in the area.

The estimated delays along 12th Street are recognized as important to AC Transit operations and passengers using the service. As stated in the Draft EIR travel times for all modes of travel within the corridor would increase by a similar amount and travelers would not be discouraged from using transit as a result of the project. Increases in travel times from the passengers' perspective would be noticeable as would travel times for automobile users. The City acknowledges that this is a potential concern for drivers and transit passengers alike but not a CEQA impact. Refer also to Response to Comment A1-12.

Response A1-10: Regarding the costs to operate transit service, costs will increase with or without the Measure DD Implementation Project. The decision to increase service along a route could be affected by the demand along the route, the attractiveness of other modes of travel, and other factors. AC Transit could decide to adapt to the increase in travel time by changing the schedule rather than by adding buses.

The purpose of the travel time analysis was to determine how automobile, bus and other traffic along these streets would be affected by the Lake Merritt and Lake Merritt Channel project components. The purpose of the analysis was not to provide information sufficient for AC Transit to develop a precise estimate of the cost of adding service to the corridor.

Response A1-11: In response to the statement that the Draft EIR does not address the potential for aggregated impacts on the same bus routes as the Measure DD project elements, the Draft EIR included an assessment of projects that were considered to be reasonably foreseeable. The existing lanes were assumed to be in place for Foothill Boulevard. Further narrowing of the travel lanes on Foothill Boulevard is not considered to be reasonably foreseeable.

Response A1-12: The comment states that increased travel time would impact passengers that use AC Transit lines because their trips would take longer and they might miss transfer connections. The City acknowledges that this is a potential operational concern for AC Transit but not a CEQA impact. The CEQA impacts of increased delay and decreased LOS at some intersections are addressed in the Draft EIR.

Although the City did not find the impact on travel time through the 12th Street corridor to be significant, it nevertheless shares AC Transit's concern with regards to impacts to bus passengers. As stated on pages 133 and 139, the City considered several potential options that might reduce bus travel times, including the addition of bus-only lanes or queue jump lanes, and the elimination of crosswalks. These measures were not recommended because they would have substantial impacts on traffic operations or pedestrian mobility. The Draft EIR recommends implementing a transit signal priority system along some transit routes, which would reduce but

not completely eliminate increases in travel time. Refer to Response to Comment A1-21 for a discussion of additional measures recommended by AC Transit. These measures will be considered by City of Oakland decision-makers during review of the merits of the project.

Response A1-13: Environmental justice does not fall under the definition of environmental impacts in CEQA and therefore is not within the purview of the Draft EIR. *CEQA Guidelines* Section 15064 states: "Economic or social changes resulting from the Project shall not be treated as significant effects on the environment." In addition, *CEQA Guidelines* Section 15131 indicates that the socioeconomic effects of a project should not be considered significant environmental impacts in and of themselves: "Economic effects of a project shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the Project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on the physical changes."

As required by CEQA, the Draft EIR focuses on the physical effects of the project, which include the increase in travel time. These effects were found to be less than significant for the reasons stated on pages 130 and 139 of the Draft EIR. Nevertheless, the City shares AC Transit's concern with regards to impacts to bus passengers. Refer to Response to Comment A1-21 for a discussion of additional measures recommended by AC Transit to reduce travel time. These measures will be considered by City of Oakland decision-makers during review of the merits of the project.

Response A1-14: The comment states that policies in the City's Land Use and Transportation Element (LUTE) encourage transit and the movement of transit vehicles and that degradation of bus service, as described in the Draft EIR, would be inconsistent with the City's transit policies. While the project would increase bus travel time in the 12th Street corridor, as described on pages 129-133 and 138-140 of the Draft EIR, a potential conflict with a single policy in a General Plan element does not inherently result in a *significant* effect on the environment within the context of CEQA. In addition, the City's General Plan has numerous policies addressing transportation issues (presented on page 121 of the Draft EIR). Policy T3.3, for example, states that the City should accept lower levels of service and a higher level of traffic congestion at Downtown intersections and intersections that provide direct access to Downtown locations. Downtown is defined in the Land Use and Transportation Element of the General Plan (page 67) as the area generally bounded by West Grand Avenue to the north, Lake Merritt and Channel Park to the east, the Oakland Estuary to the south and I-980/Brush Street to the west. This area includes much of the 12th Street corridor. The project is consistent with this policy.

Because the General Plan contains many policies, which may in some cases address different goals, some policies may compete with each other. The overall consistency of the project with the City of Oakland's policies is evaluated in Section IV.B, Planning Policy and in Appendix D of the Draft EIR. The comment is noted and the City of Oakland decision-makers, in deciding whether to approve the proposed project, will consider this information when determining whether on balance the project is consistent with the General Plan.

Response A1-15: Refer to Response to Comment A1-9.

Response A1-16: The Draft EIR applies the City's criterion of significance for transit, which the City developed in cooperation with AC Transit, that states that the project would have a significant impact on transportation if it would "generate added transit ridership that would increase the average ridership on AC Transit lines by 3 percent at bus stops where the average load factor with the project in place would exceed 125% over a peak thirty minute period." There has been no dispute that the project would not satisfy that criterion. Delays that would affect motor vehicle operations in general would have a similar effect on AC Transit operations and no special operational measures for AC Transit were considered necessary under CEQA. The Draft EIR went a step further than the normal process in Oakland for assessing impacts under CEQA and addressed corridor travel time in the spirit of disclosing additional information. However, the travel time analysis does not address a specific criterion of significance and thus does not lead directly to impact determinations. Refer also to Responses to Comment A1-12 and A1-21.

Response A1-17: The comment states that passengers expect the bus to operate on its designated route, even if that route has been made slower. Although this is likely true, route designations are changed routinely by AC Transit to accommodate changes in demand and other factors including travel time. AC Transit could change the designation of one or more routes along 12th Street if it would result in improved service for a majority of riders.

Response A1-18: The City's adopted criterion to which the comment refers reads, "Fundamentally conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle routes)." The Draft EIR finds that the project would not fundamentally conflict with transit policies because among other reasons it encourages many forms of alternative transportation, including the use of buses, by improving pedestrian linkages through the creation of a more pedestrian friendly and accessible environment in the Lake Merritt project area, including the 12th Street transit corridor.

The Draft EIR acknowledges that the project would increase travel time along 12th Street for the bus routes that travel this corridor but the traffic analysis also shows that the delays at existing intersections along these routes would not be affected or delays would be reduced (i.e., at International Boulevard and 1st Avenue, see Table IV.C-5 on page 125 of the Draft EIR). Although no mitigation is required, the City will continue to collaborate and cooperate with AC Transit to identify ways to

reduce transit delays and improve service in the project area. Refer to Response to Comment A1-21.

Response A1-19: The comment states that AC Transit is "concerned about the potential for Measure DD implementation to significantly degrade bus service to East Oakland via the 12th Street Dam," an impact of the project that is identified in the Draft EIR but is not considered significant for the reasons provided on page 130 of the document. Although the City did not find the impact to be significant, the City nevertheless shares AC Transit's operational concern. As noted on page 133 of the Draft EIR, the City will continue to work with the agency to find mutually agreeable solutions in the spirit of the Transit Street Cooperative Agreement, which the comment cites as an example of collaboration and cooperation between the City and AC Transit.

The comment correctly notes that transit bus travel times are impacted by poor intersection operations and that the impact compounds by traveling through congested corridors. While there is no significance criterion for bus transit travel times, the roadway changes identified as mitigation measures in the Draft EIR would reduce vehicle delay, which also then would reduce transit delay from unmitigated conditions. The intersection improvements identified in the Measure DD environmental studies would improve travel through the 12th Street area for all vehicles including buses, which make up 3 to 4 percent of the person trips and automobiles which make up the remaining person trips.

Response A1-20: It is acknowledged that providing transit signal priority along 12th Street and Harrison Street would be insufficient to fully mitigate the level of delay indicated by the EIR for 12th Street or Harrison Street. The Draft EIR states on page 133, "This action would reduce delays for AC Transit but not completely eliminate increases in travel time along 12th Street and Harrison Street." The Draft EIR states on page 139, ". . . the implementation of transit signal priority is not expected to completely eliminate increases in travel time along the 12th Street and Harrison Street." Refer to Response to Comment A1-21 for additional recommendations the City is considering to reduce travel time.

Response A1-21: The City has evaluated the feasibility of implementing AC Transit's requested design modifications for reducing travel time along the 12th Street corridor and agrees to consider passive transit signal priority and changes to eastbound bus lanes. These design details do not substantially change the project and would not create new impacts.

The City declines to modify the bus lane in the westbound direction because the westbound bus lane would have significant implications for the project design, would be counter to project objectives (e.g., it would reduce the area of park land created), and would likely provide the least benefit for travel time of the measures proposed by AC Transit. Right-of-way constraints prevent widening the street east of the Lake Merritt Channel Bridge. Widening the bridge itself would reduce open water below, reduce open sky for pedestrians below and be very expensive. Without widening the Lake Merritt Channel Bridge a westbound bus lane could be

extended only from just west of the bridge to the 11th-12th/14th Street intersection. Parking would have to be eliminated on the north side of 12th Street between the bridge and the 11th-12th/14th Street intersection and the roadway would need to be widened into the park. The incremental reduction in travel time, which was not a significant impact of the project, does not justify the impacts (e.g., loss of parking, reduced size of park, etc.) that the requested change would make.

An analysis was performed to determine the extent to which the measures proposed by AC Transit could be implemented without causing significant intersection impacts. The following scenarios were evaluated:

1. Recommendations proposed in the DEIR (with refinements in signal phasing to better accommodate pedestrian movements)[1]

2. Bus lane on the 11th Street (with crosswalks proposed in the DEIR)

3. Bus lane on the 11th Street and elimination of southeast crosswalk

Scenarios 2 and 3 would provide continuation of the bus lane through the signal at the 11th-12th/14th Street intersection, after which buses would share lanes with other motor vehicles.

The analysis of traffic operations showed that a relatively long cycle length[2] would be required during the AM peak hour for all the scenarios above. The scenarios intended to at least partially accommodate AC Transit's request (No. 2 and 3, above) would require relatively long cycle lengths during the PM peak hour. The DEIR recommendation (No. 1, above) would allow a signal cycle half the long cycle during the PM peak hour.

A short cycle length is desirable for two reasons. First, short cycle lengths provide shorter wait times for pedestrians and result in better pedestrian compliance with traffic regulatory devices. Second, short cycle lengths generally result in shorter vehicle queue lengths than long cycle lengths.

To compare the DEIR recommendation with the other scenarios, a long cycle length was analyzed and would provide lower delay for motor vehicles than the shorter cycle length suggested to better accommodate pedestrians. The analysis showed that all scenarios could be implemented without causing significant level of service impacts at the 11th-12th/14th Street intersection. The results of the analysis

[1] The DEIR analysis assumed pedestrians would cross the southeast leg of the 11th-12th/14th Street intersection during the signal phase that would serve eastbound right turning traffic from 11th Street to 12th Street. The signal phasing concept was revised to provide a separate pedestrian phase that would provide a protected phase for pedestrians. Details of the revised signal phasing concept are provided in the Appendix.

[2] The DEIR analysis evaluated 50 and 100 second cycle lengths for the intersections along the 12th Street – 14th Street corridor. The analysis conducted for the updated analysis showed that a 100-second cycle length would be required during the a.m. peak hour but that a 50-second cycle length would be possible during the p.m. peak hour.

are summarized in the table, below. Detailed analysis worksheets are provided as Appendix A.

Intersection Levels of Service – Cumulative (2025) Conditions for 11th-12th St/14th Street Intersection

Scenario	AM Peak Hour		PM Peak Hour	
	LOS[a]	Delay[b]	LOS[a]	Delay[b]
DEIR Recommendation (50 second PM signal cycle)	B	14.6	D	37.8
DEIR Recommendation (100 second PM signal cycle)	B	14.6	C	28.2
Bus lane on the 11th Street	B	14.9	C	32.4
Bus lane on the 11th Street and elimination of southeast crosswalk	B	16.7	C	34.3

Notes:
[a] LOS = Level of Service
[b] Average control delay in seconds per vehicle
[c] Defined as a downtown intersection
Source: Dowling and Associates, 2007.

The City will work with AC Transit to determine the feasibility of implementing the measures included in the analysis. The bulleted list of recommendations on page 133 of the Draft EIR is revised as follows:

Transit Recommendations

- The City should provide <u>active and/or passive</u> transit signal priority to reduce travel times along 12th Street and Harrison Street. This action would reduce delays for AC Transit but not completely eliminate increases in travel time along 12th Street and Harrison Street.
- <u>The City should provide an eastbound bus lane along the right side of 11th Street with the bus lane continuing through the signal at the 11th-12th/14th Street intersection.</u>

The bulleted list of recommendations on pages 139-140 of the Draft EIR is revised as follows:

<u>Transit</u> Recommendations

- Implementation of <u>active and/or passive</u> transit signal priority as described in the previous recommendations for transit service would reduce delays for AC Transit. Nevertheless, the implementation of transit signal priority is not expected to completely eliminate increases in travel time along the 12th Street and Harrison Street. ~~While adding bus-only lanes or queue jump lanes, or eliminating pedestrian crosswalks are feasible, they are not recommended because they would have substantial impacts on traffic operations or pedestrian mobility, and in most cases have additional costs.~~

- The City should provide an eastbound bus lane along the right side of 11th Street with the bus lane continuing through the signal at the 11th-12th/14th Street intersection.

Response A1-22: The comment states that the increases in transit travel time in the vicinity Harrison Street between 20th and Grand Avenue are of concern to AC Transit. It also recommends that planning should be coordinated for the Measure DD Implementation Project and the Grand-Macarthur Rapid Project. The City and AC Transit are engaged in ongoing discussions to resolve transit issues associated with their respective proposed projects, including the Measure DD Implementation and Grand-Macarthur Rapid Projects.

Making San Francisco Bay Better

August 27, 2007

Elois A. Thornton
City of Oakland
Community and Economic Development Agency
Planning Division
250 Frank H. Ogawa Plaza, Suite 3315
Oakland, CA 94612

Subject: BCDC Inquiry File No. AL.MC.7517.2. Juris. Det. File No. AL.AL.6000.3. Measure DD Implementation Project Draft Environmental Impact Report. (State Clearinghouse #2006122048.)

Dear Ms. Thornton:

Thank you for the opportunity to comment on the Measure DD Implementation Project Draft Environmental Impact Report (DEIR) for the City of Oakland. The DEIR is dated July 2007, and was received in our office on July 24, 2007. The Commission has not reviewed the DEIR, so the following staff comments are based on the *San Francisco Bay Plan* (Bay Plan) and the McAteer-Petris Act and staff review of the DEIR.

Jurisdiction. Chapter IV, page 95 of the DEIR defines the BCDC jurisdiction as, "all areas of the San Francisco Bay, a shoreline band of 100 feet from the water, and salt ponds, managed wetlands and certain waterways." It states that "Measure DD includes waterfront improvements within 100 feet of the shoreline," that will require BCDC permit approval. In addition to the above description of the BCDC jurisdiction, the EIR should state that the southern portion of the Lake Merritt Channel (to the 7th Street Pump Station) falls within The Commission's bay jurisdiction, and that Measure DD improvements involving placement or removal of fill in the Bay will require BCDC permit approval. **1**

It is not clear from the DEIR if the Measure DD improvements include an operational 7th Street tide or flood gate. If a tide or flood gate is not included, the EIR should recognize that changes may result to the Commission's jurisdiction in the Channel and Lake. **2**

Public Access. To be consistent with the discussion of other applicable regulatory documents in the Planning Policy section (Chapter IV, Section B), the EIR should reference the Bay Plan policies on Public Access that will apply in BCDC permits issued for Measure DD projects. **3**

Fish, Other Aquatic Organisms and Wildlife. BCDC's Bay Plan findings and policies on Fish, Other Aquatic Organisms and Wildlife address protection of these resources. The summary of the McAteer Petris Act in the Biological Resources section (page 204) of the EIR should also state that, in reviewing permit applications for projects within its jurisdiction, BCDC relies on these Bay Plan policies to ensure protection of biological resources. **4**

Tidal Marshes and Tidal Flats. BCDC's Bay Plan findings and policies also address Tidal Marshes and Tidal Flats. These policies state, in part, "Projects should be sited and designed to avoid, or...minimize adverse impacts on any transition zone present between tidal and upland habitats." Additionally, the policies require that "Any tidal restoration project... include clear **5**

Letter
A2
cont.

and specific long-term and short-term biological and physical goals, and success criteria and a monitoring program to assess the sustainability of the project."

The DEIR states on page 35 that, "Measure DD Implementation Project Components along the channel are intended to… restore wetlands," and Figure III-4 appears to indicate that restoration of tidal marsh is proposed for the Channel south of 7th Street. Proposed improvements at the 66th Avenue Gateway (page 57) also appear to potentially affect tidal marsh and transition zone habitat. The EIR should recognize Bay Plan policies on Tidal Marshes and Tidal Flats that will apply to these Measure DD project components. **5 cont.**

Sea Level Rise and Safety of Fills. Bay Plan findings and policies anticipate the need for planning associated with safety of fills and sea level rise. The Safety of Fills findings recognize that "Bay water levels are likely to increase in the future because of a relative rise in sea level… Relative rise in sea level is the sum of: (1) a rise in global sea level and (2) land elevation change (lifting and subsidence) around the Bay." Policy 5 states, in part, "…structures on fill or near the shoreline should be above the highest estimated tide level for the expected life of the project water level during the expected life of the project or be sufficiently protected by levees…" Additionally, Policy 6 states, "local governments and special districts with responsibilities for flood protection should assure that their requirements and criteria reflect future relative sea level rise and should assure that new structures and uses attracting people are not approved in flood prone areas or in areas that will become flood prone in the future, and that structures and uses that are approvable will be built at stable elevations to assure long-term protection from flood hazards." **6**

Projects in BCDC jurisdiction that involve bay fill must be consistent with the Bay Plan policies on the safety of fill and sea level rise. The EIR should include these Bay Plan policies in the Regulatory Framework discussion in Chapter IV, Section H (beginning on page 249).

Increased Tidal Action in Lake Merritt Channel. In the discussion of hydrology and water quality impacts (pages 261 and 263), the DEIR states that the replacement of culverts under 12th and 10th streets with clear-span bridges, and reconfiguration of the 7th Street channel would double (approximately) the flow rate through Lake Merritt Channel. Based on studies of the flow changes, the DEIR concludes that this "ability of the channel to convey more water out of the Lake…could alleviate flooding conditions." The EIR should specify what factors these studies analyzed to project future flow rates and flooding conditions. If the studies are based solely on past tidal ranges, they may not sufficiently describe potential flooding impacts. For example, combined conditions of increased tidal action on the Channel and Lake, storm surge and climate change-related sea level rise could affect flooding risk for the project area. The EIR should consider these additional factors in assessing the hydrology and water quality impacts of the Measure DD improvements. **7**

Additionally, the description of impacts to biological resources (beginning page 210), should address whether tidal flow changes to the Lake and Channel will significantly affect habitats in any of the project areas. **8**

If you have any questions regarding this letter, or any other matter, please contact Joe LaClair by phone at 415 352-3656 or email joel@bcdc.ca.gov.

Sincerely,

SARA POLGAR
Planner

LETTER A2
Bay Conservation and Development Commission (BCDC)
Sara Polgar, Planner
August 27, 2007

Response A2-1: The comment cites text on page 95 of the Draft EIR that defines the Bay Conservation and Development Commission's (BCDC) jurisdiction and recommends that the Draft EIR clarify the boundary of BCDC's authority in the southern portion of the Lake Merritt Channel. It also recommends that the Draft EIR state that project actions that involve placement or removal of fill in the Bay will require BCDC permit approval. The City agrees to make the recommended changes, which clarify the permit process for the project but do not alter the analysis or conclusions of the EIR. The third paragraph on page 95 of the Draft EIR is revised to include this information. Because this paragraph is revised in response to more than one comment refer to Response to Comment A2-3 below for the revised text.

Response A2-2: The comment requests that the Draft EIR clarify whether a tide or flood gate is included at 7th Street Pump Station. The second paragraph on page 36 of the Draft EIR is revised as follows:

This reconfiguration would include the continuation of pathways established as part of the 12th Street and 10th Street project components, the improvement of pedestrian tunnels under 7th Street, and the installation of a new traffic signal and crosswalk across 7th Street. The 7th Street project component proposes the creation of a bypass channel to improve recreational access, as well as to allow large fish to once again enter the upper Lake Merritt Channel and Lake Merritt. <u>The bypass channel would be designed and managed to retain the tidal and flood control functions of the pump station. To ensure that the flood control function of the 7th Street Pump Station is not compromised, the new bypass channel would include a hydraulic gate that would be closed when operation of the pumps is required to lower the water level in the lake.</u>

Response A2-3: The comment requests that the Draft EIR reference the Bay Plan policies on public access that will apply in BCDC permits. Accordingly, the Draft EIR on page 95 is revised as follows:

e. San Francisco Bay Plan. The San Francisco Bay Plan[9] (Bay Plan) is a policy tool that, under the provisions of the McAteer-Petris Act, allows the San Francisco Bay Conservation and Development Commission (BCDC) to "exercise its authority to issue or deny permit applications for placing fill, extracting materials, or changing the use of any land, water, or structure within the area of its jurisdiction," an area that includes all of the San Francisco Bay, a shoreline band of 100 feet from the water, and salt ponds, managed wetlands and certain waterways associated with the Bay. The Bay Plan stipulates: "Any public agency or private owner holding shoreline land is required to obtain a permit from the Commission before proceeding with (shoreline) development." <u>The Bay Plan contains findings and policies that will apply in BCDC permits for Measure DD project components</u>

within the commission's jurisdiction. Examples of applicable policies include those related to public access, the placement and removal of fill in the Bay, sea level rise and the safety of fills, the protection of fish, other aquatic organisms and wildlife, and tidal marshes and tidal flats, among others. Implementation of the proposed project would require BCDC permit approval for development within the 100-foot shoreline band. Measure DD includes waterfront improvements within 100 feet of the shoreline~~.~~, including areas along the Oakland Estuary and the southern portion of the Lake Merritt Channel, downstream of the 7th Street Pump Station.

Response A2-4: The comment requests that the EIR state that, in reviewing permit applications for projects within its jurisdiction, BCDC relies on findings and policies on Fish, Other Aquatic Organisms and Wildlife in the Bay Plan to ensure protection of biological resources. The City agrees to include the findings and policy information and revise the Draft EIR on page 204 as follows:

(4) McAteer-Petris Act. The McAteer-Petris Act and Suisun Marsh Preservation Act were adopted to protect San Francisco Bay and Suisun Marsh as natural resources for the benefit of the public and to encourage development compatible with this protection. The San Francisco Bay Conservation and Development Commission (BCDC) was established to enforce this Act. The two primary goals of the BCDC are: (1) to prevent the unnecessary filling of San Francisco Bay; and (2) to increase public access to and along the Bay shoreline. BCDC approval is required for all projects within 100 feet of the Bay shoreline, as well as projects that propose any filling or dredging within Bay waters. In reviewing permit applications, BCDC relies on findings and policies on fish, other aquatic organisms and wildlife in the Bay Plan to ensure protection of biological resources.

Response A2-5: The comment requests that the EIR recognize that policies on tidal marshes and tidal flats will apply to Measure DD project components. The City agrees to include the additional policy information that BCDC will consider during the permitting process. Refer to Response to Comment A2-3 for revisions to the text.

Response A2-6: The comment requests that the EIR recognize that policies on sea level rise and the safety of fills will apply to Measure DD project components. The City agrees to include the additional policy information that BCDC will consider during the permitting process. Refer to Response to Comment A2-3 for revisions to the text. Refer to Response to Comment A2-7 for additional discussion of sea level rise.

Response A2-7: The 7th Street Pump Station provides flood protection for areas upstream of 7th Street by allowing water levels in Lake Merritt to be lowered during storm events that coincide with high tides. This function and the operation of the 7th Street Pump Station are described on pages 35 (Project Description) and 246 (Hydrology and Water Quality) of the Draft EIR. A hydraulic gate in the new bypass channel at the 7th Street facility would be closed when operation of the pumps is required to lower the water level in the lake, which currently occurs about 1 percent of the time (i.e., a few days per year). Rising average tidal levels downstream of the flood station may increase the frequency with which the pumps would need to operate but increased operation would not compromise their function. The text is revised as indicated in Response to Comment A2-2 to clarify the operation of the 7th Street Pump Station.

Under certain conditions the pumps currently lower the water level in the Channel faster than it can be replenished by flows through the culverts beneath 10th and 12th Street. Removal of the culverts at 10th and 12th Streets, lowering of the channel at 12th Street, and creation of an open channel in these areas as part of the project (page 35 of the Draft EIR) would improve the flow of water between the lake and the pump station. These actions would help alleviate upstream flooding by allowing the pumping system to operate more efficiently.

Coastal flooding is acknowledged as a potential impact on pages 246 and 261 of the Draft EIR. As with many facilities built near the shore of San Francisco Bay, rising sea levels associated with global climate change could ultimately affect the pump station if they rise to extreme levels. The pump station's function would be compromised if, for example, extreme high tides overtopped the facility. However, the flood control components and operation of the 7th Street Pump Station itself would not be altered by the project. In addition, the project is not constructing housing, high occupancy, or sensitive facilities within the zone that could be affected by rising sea levels. Thus, the impact of the project would be less than significant. The text at the bottom of page 261 of the Draft EIR is revised as follows:

- <u>As with many facilities built near the shore of San Francisco Bay, rising sea levels associated with global climate change could, in the long-term, affect project facilities and existing infrastructure such as the 7th Street Pump Station that are designed to protect them from flooding. The pump station's function would be compromised if, for example, tidal levels overtopped the facility. However, the flood control components and operation of the 7th Street Pump Station itself would not be altered by the project. New trails are being located above the current reach of tidal action, with additional freeboard which will accommodate some future sea level rise. In addition, the project is not constructing housing, high occupancy, or sensitive facilities within the zone that could be affected by flooding or rising sea levels.</u>

Response A2-8: Increased tidal flows would not cause adverse changes to the open water or upland habitats (described on pp. 188-189 of the Draft EIR) that occur in the vicinity of Lake Merritt or the Lake Merritt Channel. The increased tidal flows would have no effect on the upland habitat, which is landscaped parkland. The new flow regime would not *adversely* affect the relevant water quality characteristics of the open water habitat such as salinity, temperature and dissolved oxygen. Water quality would be improved by the greater exchange rate between Lake Merritt and the estuary and by newly created tidal wetlands. As the channel is not a corridor for the movement of migratory fish, the increased flow rate would have no effect on migratory fish species. The following text is inserted on page 216 of the Draft EIR at the end of subsection IV.F.2.c(3):

<u>The increased tidal flows that would occur as a result of the proposed modifications to the Lake Merritt Channel are not expected to cause adverse changes to the open water habitat in Lake Merritt or the Lake Merritt Channel. Increased tidal flows would not adversely affect the relevant water quality characteristics of the open water habitat such as salinity, temperature, and dissolved oxygen. Water quality, especially dissolved oxygen, would be improved by the greater exchange rate between</u>

Lake Merritt and the estuary and by newly created tidal wetlands in the channel, which would benefit wildlife.

The text at the beginning of subsection IV.F.2.c(4) on page 216 of the Draft EIR is revised as follows:

(4) Native Resident or Migratory Wildlife Movement, Wildlife Corridors, or Nursery Sites. As the channel is not a corridor for the movement of migratory fish, the proposed changes to Lake Merritt and Lake Merritt Channel would not have an adverse effect on migratory fish species. Several species of migratory waterbirds have been observed using the Lake Merritt Channel during the winter (approximately October through March), often in flocks of 40 to 70 birds (e.g., scaup, common goldeneye). A 2004 study of waterbird use and disturbance response within Berkeley's Aquatic Park found that disturbance sensitivity was positively related to flock size, with large flocks flushing more readily than smaller ones.[37] Although no such studies have been conducted at the Lake Merritt Channel, LSA observed a flock of approximately 50 common goldeneyes swimming away from a group of schoolchildren crossing the pedestrian bridge during the January 19 site visit, indicating sensitivity to disturbance. Human-caused disturbance negatively affects wintering ducks by causing the expenditure of energy (i.e., flying or moving away from the source of disturbance) that would otherwise be used for behaviors necessary for survival, such as resting or feeding.[38] Repeated or periodic disturbance would cause a greater expenditure of energy and thus have a greater effect on wintering birds than singular events.

RE: City of Oakland Measure DD Implementation Project
Environmental Impact Report (SCH # 2006122048

Dear Ms Elois:

The Alameda County Flood Control and Water Conservation District (District) has reviewed the City's Environmental Impact Report entitled: *City of Oakland Measure DD Implementation Project Environmental Impact Report* and has the following comments:

The District owns and maintains several flood control facilities within the proposed project limits. These facilities include, but not limited to, District designated Zone 12 Lines B, C, and Line D. These creeks for the most part, flow in underground culverts that outfall at Lake Merritt. In addition the District owns and operates a pump station located on the outfall channel at 7th Street crossing.

The proposed project *Group 1 Lake Merritt and Lake Merritt Channel Improvements* described in the EIR pages 27-29 Table III-1 of the EIR could potentially result in significant impacts to District facilities. The proposed reconstruction and construction of the retaining walls along the banks of Lake Merritt could potentially undermine the integrity of existing culvert outfalls. This is a significant construction related impact requiring mitigation. Please provide adequate explanation of how the City proposes to mitigate this impact. **1**

The District owned pump station at 7th Street crossing currently provides effective flood protection to a large area within and outside the proposed project limits. Modifications and changes proposed (described on page 39 and shown on Figure III-4 and in section g page 365 of the EIR) could significantly affect the pump station structure and operations; and on page 263 the EIR describes "doubling of the flow rate through the Lake Merritt channel". There are several potential ramifications to the changes proposed: **2**

1) The new bypass channels would potentially change the hydrology at the pump station requiring redesign and significant operational changes of the facility;
2) There is no clarification of how water levels in the bypass channel will be maintained to support boat traffic. The channel is under tidal ebb and flow.

Letter
A3
cont.

Comments –City of Oakland Measure DD EIR
Sept 10, 2007

3) The new bypass channels adjacent to the 7th Street Pump Station will require continuous maintenance. The EIR is unclear on how the City proposes to maintain the facility without compromising the flood protection functions of the pump station.
4) The District is concern about the potential safety and liability associated with the changes described in the EIR.

2 cont.

None of these significant issues requiring mitigation was adequately addressed in the EIR. In fact, it was concluded on page 258 in the checklist item that "it is less than significant". The District disagrees and requests that these issues be adequately addressed before approval of the EIR.

Under (*Group 4) City–Wide Creek Restoration, Preservation and Acquisition (described on pages 58 and on several other sections of the EIR).* The District is responsible for nearly all the major creeks and channel in the City of Oakland. Many of these creeks are located in high density population centers that may become prone to flooding with significant changes as described in the documents (i.e.; daylighting underground creeks). Potential impacts associated with this activity have not been addressed in the EIR. Please provide adequate mitigation. The District also requests that improvements and/or, restoration on any of these creeks that affect District facilities should be coordinated with the District hydrologist.

3

On pages 287-308: The EIR describes occurrences of high levels of various hazardous compounds, including lead at locations within the project limits. Yet no remediation other than citations of various local and state regulations governing these materials was provided. There is potential risk of these "localized" occurrences especially in the Lake Merritt Channel being transported (with tidal flows) into the lake with excavation and widening of the channel. This will potentially affect the wildlife resources occurring in the lake. Remediation is required.

4

The District requests copies of the technical studies for the 7th St. bypass channel concept including those prepared by Rajappan & Meyer Consulting Engineers 2007 *Lake Merritt conveyance capacity 1826-1827 Hydraulic modeling prepared for the City of Oakland 17 January.*

5

The District appreciates the opportunity to provide comments on the EIR and supports the overall goal of improving Lake Merritt and its environs. This comment letter is being sent electronically and by US Postal Services.

Yours truly,

Kwablah Attiogbe,
Environmental Services Supervisor

KA

LETTER A3
Alameda County Flood Control and Water Conservation District
County of Alameda Public Works Agency
Kwablah Attiogbe, Environmental Services Supervisor
September 10, 2007

Response A3-1: The comment states that the reconstruction and construction of retaining walls along the shore of Lake Merritt could potentially impact the integrity of the Alameda County Flood Control and Water Conservation District's underground culverts that outfall at Lake Merritt. The comment seeks assurance that these facilities will not be damaged during project construction activities. Implementation of the City's Uniformly Applied Development Standard Conditions of Approval for the project will ensure that District facilities are not be damaged.

The City's Conditions of Approval are incorporated as part of the project as explained on page 64 and 65 of the Draft EIR. Condition 75, provided on page 257 of the Draft EIR, requires that the City obtain all necessary regulatory permits and authorization from the District prior to construction and comply with all conditions issued by the District. Issuance of permits and compliance with the District's conditions will ensure that the District's facilities are not damaged. The last paragraph on page 261 of the Draft EIR is revised as follows to clarify this point:

Substantial quantities of new impervious surfaces, which could increase runoff rates and velocities (and potentially flooding), would not be created by Measure DD project components. The integrity and function of existing flood control and stormwater conveyance facilities operated by the Alameda County Flood Control and Water Conservation District, such as stormwater outfalls at Lake Merritt, would be ensured by obtaining permits and authorizations from the District prior to construction as required by Condition of Approval 75. ~~Construction of housing is not a proposed element of the project, and no new residential development would be subject to flooding.~~ Therefore, no substantial impact related flood hazard or redirection of flood water would occur with the proposed Measure DD components.

Response A3-2: The comment states that for the 7th Street Pump Station significant issues requiring mitigation were not adequately addressed in the Draft EIR. The comment identifies concerns that the new bypass channel at the 7th Street Pump Station could potentially change the hydrology of the pump station thereby affecting the safety and flood control functions of the pump station. The comment also requests clarification of how water levels would be maintained to support boat traffic.

The proposed modifications to the 7th Street Pump Station and Lake Merritt Channel are described on pages 35 and 36 of the Draft EIR. As noted therein, the 7th Street project components have been designed to the conceptual stage. The environmental analysis of the Draft EIR relied on studies prepared for this early stage of project development, including the hydraulic analyses cited on pages 261

and 263 of the Draft EIR. The studies, the hydraulic model of the Channel, and the conceptual designs were developed in close cooperation with Alameda County Public Works staff, including their hydrologist, design engineers, and operations staff. The studies conclude that the proposed modifications to the Lake Merritt Channel would improve flood control and safety. Therefore, no mitigation is recommended for these issues. Also refer to Response to Comment A2-2 for revised text that explains how the flood gate in the bypass channel would function.

Additional designs for the bypass of the 7th Street Pump Station are required and will be prepared before the project can be permitted and constructed. As required by Condition of Approval 75, structures within the floodplain or floodway, such as the 7th Street Pump Station, are subject to the regulatory permits and authorizations from the District. Compliance with the District's requirements would ensure that the flood control functions of the pump station are not adversely affected by the project. These studies would also be used to determine how water levels would be maintained for recreational boaters so as not to interfere with the flood control function of the pump station. To clarify that this process is required as part of the project, the text of the EIR is revised on pages 263 and 264 as follows:

These three components are designed to improve tidal exchange between Lake Merritt and San Francisco Bay by clearing and broadening the channel to approximately 100 feet at the outlet from Lake Merritt and at 10th Street. New clear-span bridges would be constructed after removal of existing culverts under 12th and 10th streets. ~~and by reconfiguring the channel at 7th Street~~, The proposed changes would ~~resulting in~~ approximately double~~ing~~ the flow rate through the Lake Merritt Channel in this area.[50, 51] These components are also intended to improve pedestrian and bicycle circulation in the area of the Channel, and along with other components, enhance and improve the environment of Lake Merritt and surrounding parks. Redesign of the Channel at the Lake Merritt Flood Control Station at 7th Street is at the conceptual design stage. As noted previously, hydraulic studies conducted at this stage of project development indicate that the proposed changes to the Lake Merritt Channel would help alleviate flooding conditions. Nevertheless, as required by Condition of Approval 75 this project component would be required to obtain all necessary permits and authorizations from the Alameda County Flood Control and Water Conservation District prior to construction to ensure that the operation of the flood control facilities at 7th Street would not be adversely affected by the proposed action. Topics of wildlife, aquatic life, vegetation, landscaping, creek restoration, U.S. Army Corps of Engineers Section 404 (filling and grading in wetlands) permitting, California Department of Fish and Game Section 1604 – Streambed Alteration Agreements, and San Francisco Bay Conservation and Development Commission (BCDC) requirements are addressed in the Biological Resources section of this DEIR.

Response A3-3: The comment incorrectly states that potential flooding impacts associated with the City-Wide Creek Restoration, Preservation and Acquisition Group have not been addressed in the Draft EIR. Flooding issues associated with all project components, including creek restoration, preservation and acquisition activities, are analyzed on page 261 of the Draft EIR. As noted therein, activities associated with the City-wide Creeks group of projects are intended, in part, to reduce flooding. In addition, the project incorporates numerous Conditions of Approval, as described on pages 253 to 257 of the Draft EIR, to ensure that project activities, including creek

restorations, will not create significant flooding impacts. Thus, the Draft EIR concludes that potential flooding impacts are less than significant.

The comment also requests that the City coordinate with the District's staff if creek restoration or improvement activities would affect District facilities. The studies, the hydraulic model of the Channel, and the conceptual designs upon which the analysis in the Draft EIR is based were developed in close cooperation with Alameda County Public Works staff, including their hydrologist, design engineers, and operations staff. The City will continue to coordinate with District staff during the permitting and authorization process as required by Condition of Approval 75, which is included as part of the project.

Response A3-4: The comment incorrectly states that the Draft EIR relies on local and State regulations to address the presence of hazardous compounds that may be encountered during construction. It also expresses concern that disturbance of contamination in Lake Merritt Channel could adversely affect wildlife in Lake Merritt and states that mitigation is required.

Several Conditions of Approval, which go beyond regulatory requirements, are identified on pages 298 and 299 of the Draft EIR. Conditions of Approval 50 and 52, for example, require the preparation of Phase I and Phase II studies and remedial actions, as necessary, conducted in consultation with local, State and federal environmental regulatory agencies. These Conditions of Approval are included as part of the project, as noted on pages 64 and 65 of the Draft EIR, and would reduce potential impacts associated with hazardous compounds in soil or other environmental media. Implementation of these measures would ensure that project activities do not adversely affect water quality and wildlife resources at Lake Merritt.

Response A3-5: The comment requests copies of the technical studies for the 7th Street bypass channel concept. The studies are part of the administrative record for the project, which is available at the City of Oakland, Community and Economic Development Agency, Planning and Zoning Division, 250 Frank H. Ogawa Plaza, Suite 3315. The City has provided copies of the documents to the District as part of the earlier cooperative design process.

EAST BAY
MUNICIPAL UTILITY DISTRICT

August 28, 2007

Elois A. Thornton, Planner IV
City of Oakland
Community and Economic Planning Agency
250 Frank H. Ogawa Plaza, Suite 3315
Oakland, CA 94612

Re: Draft Environmental Impact Report for the City of Oakland Measure DD Implementation Project

Dear Ms. Thornton:

East Bay Municipal Utility District (EBMUD) appreciates the opportunity to comment on the Draft Environmental Impact Report (EIR) for the City of Oakland Measure DD Implementation Project. EBMUD has the following comments.

WATER SERVICE

EBMUD's Central and Pressure Zone, with a service elevation range of 0 to 100 feet, and Aqueduct Pressure Zone, with a service elevation range of 100 to 200 feet, serve the area incorporated in the Measure DD Project. When the development plans are finalized, the project sponsor should contact EBMUD's New Business Office and request a water service estimate to determine the costs and conditions of providing water service to the project. Engineering and installation of water mains and services requires substantial lead time, which should be provided for in the project sponsor's development schedule. **1**

Since several of the proposed project areas have a potential to contain contaminated soil and/or groundwater, the project sponsor should be aware that EBMUD will not install piping or services in contaminated soil or groundwater (if groundwater is present at any time during the year at the depth piping is to be installed) that must be handled as a hazardous waste, or that may be hazardous to the health and safety of construction and maintenance personnel wearing Level D personal protective equipment. EBMUD will not install piping or services in areas where groundwater contaminant concentrations exceed specified limits for discharge to the sanitary sewer system and sewage treatment plants. **2**

The project sponsor must submit copies to EBMUD of all known information regarding soil and groundwater quality within or adjacent to the project boundary and a legally sufficient, complete and specific written remediation plan establishing the methodology, planning and design of all necessary systems for the removal, treatment, and disposal of contaminated soil and groundwater. EBMUD will not design piping or services until

Letter
A4
cont.

soil and groundwater quality data and remediation plans have been received and reviewed, and will not start underground work until remediation has been carried out and documentation of the effectiveness of the remediation has been received and reviewed. If no soil or groundwater quality data exists, or the information supplied by the project sponsor is insufficient, EBMUD may require the project sponsor to perform sampling and analysis to characterize the soil and groundwater that may be encountered during excavation or EBMUD may perform such sampling and analysis at the project sponsor's expense. If evidence of contamination is discovered during EBMUD work on the project site, work may be suspended until such contamination is adequately characterized and remediated to EBMUD standards.

2 cont.

WASTEWATER

On page 325, second paragraph, please delete the sentences stating, "This wastewater would be accommodated by the MWWTP, which is currently operating at 48 percent of its secondary treatment capacity. The increase in wastewater generated by these projects is not substantial in the context of the entire volume of wastewater process by EBMUD's Main Wastewater Treatment Plant." While there is available capacity during dry weather, this volume is meant to ensure adequate capacity during wet weather events. The phrasing in the Draft EIR incorrectly implies that EBMUD does not fully utilize the available capacity.

EBMUD's Main Wastewater Treatment Plant is anticipated to have adequate dry weather capacity to treat the proposed wastewater flow from this project, provided this wastewater meets the standards of EBMUD's Environmental Services Division. However, the City of Oakland's Infiltration/Inflow (I/I) Correction Program set a maximum allowable peak wastewater flow from each subbasin within the City and EBMUD agreed to design and construct wet weather conveyance and treatment facilities to accommodate these flows. EBMUD prohibits discharge of wastewater flows above the allocated peak flow for a subbasin because conveyance and treatment capacity for wet weather flows may be adversely impacted by flows above this agreed limit.

3

WATER CONSERVATION

The proposed project presents an opportunity to incorporate water conservation measures. EBMUD would request that the City of Oakland include in its conditions of approval a requirement that the project sponsor comply with the Landscape Water Conservation Section, Article 10 of Chapter 7 of the Oakland Municipal Code. EBMUD staff would appreciate the opportunity to meet with the project sponsor to discuss water conservation programs and best management practices applicable to the integrated projects. A key objective of this discussion will be to explore timely opportunities to expand water conservation via early consideration of EBMUD's conservation programs and best management practices applicable to the project.

WRK:TNS:sb
sb07_217.doc

LETTER A4
East Bay Municipal Utility District (EBMUD)
William Kirkpatrick, Manager of Water Distribution Planning
August 28, 2007

Response A4-1: The comment states that the City should coordinate with EBMUD as the project plans are finalized to determine the costs and conditions of providing water service to the project. The comment is noted.

Response A4-2: The comment states that evidence of remediation of known contamination or information to confirm the absence of contamination must be provided to EBMUD before the district will design or install pipelines for the project in potentially contaminated areas. The City's Standard Condition of Approval 50: Phase I and/or Phase II Reports and Standard Condition of Approval 52: Environmental Site Assessment Reports Remediation are included as part of the project as noted on page 303 of the Draft EIR. These Conditions of Approval require the completion of an environmental investigation and remedial action prior to the initiation of ground-disturbing activities within the project site. Implementation of the Conditions of Approval would ensure that EBMUD workers or other construction personnel would not face health risks from soil or groundwater contamination during the installation of water or sewer lines. Data on soil and groundwater contamination with the Project site will be submitted to EBMUD prior to the installation of utility lines.

Response A4-3: The comment states that the Draft EIR mischaracterizes EBMUD's utilization of its available treatment capacity and recommends deletion of text to correct the error. The comment also notes that the City and EMBUD have agreed to design and construct wet weather conveyance and treatment facilities to accommodate the wastewater flows set forth in the City's Infiltration/Inflow (I/I) Correction Program. The comments are noted and the City agrees to make the recommended change. The comments and the recommended change to the text do not alter the analysis or conclusions of the Draft EIR. The second paragraph on page 325 of the Draft EIR is revised as follows:

Wastewater generated by the Measure DD Implementation Project components represents less than 0.1 percent of the MWWTP's secondary treatment capacity. ~~This wastewater would be accommodated by the MWWTP, which is currently operating at 48 percent of its secondary treatment capacity. The increase in wastewater generated by these projects is not substantial in the context of the entire volume of wastewater processed by EBMUD's Main Wastewater Treatment Plant.~~ EBMUD has sufficient capacity to treat wastewater flows from the projects during dry weather[19] and would not require or result in construction of new wastewater treatment facilities or expansion of existing facilities, construction of which could cause significant environmental effects.

Response A4-4: EBMUD requests that the City include water conservation measures in its Conditions of Approval for the project in accordance with the Landscape Water Conservation Section of the City's Municipal Code and that the City meet with EBMUD to discuss water conservation programs and best management practices. The comment is noted and will be considered by the City of Oakland decision-makers during review of the merits of the project.

RE: EAST BAY REGIONAL PARK DISTRICT COMMENTS ON THE DEIR PREPARED FOR THE MEASURE DD IMPLEMENTATION PROJECT

Dear Ms. Thornton:

Thank you for providing East Bay Regional Park District with a copy of the Draft Environmental Impact Report for the Measure DD Implementation Project. The District currently maintains and operates Martin Luther King Jr. Regional Shoreline where a segment of the San Francisco (SF) Bay Trail spans from just south of the Hanson Aggregate property to 66th Avenue. Currently under construction at the northern portion of the Shoreline, between East Creek Point and the Hanson Aggregate property, is an improved segment of the Bay Trail, landscaping, picnic areas, a wildlife observation/fishing pier, a service yard, paved entry road, parking lot and other appurtenant facilities necessary to serve these improvements. A portion of this area will be leased by the Oakland Strokes rowing club for the construction and operation of new boating and security facilities for the club.

The District has identified as a priority in its adopted Master Plan the completion of missing sections of the SF Bay Trail and is pleased that the "Waterfront Trail and Access Improvements" (Group 2) component of the Measure DD implementation project is intended to connect Martin Luther King Jr. Regional Shoreline to Estuary Park and Jack London square via the SF Bay Trail. With more than 1,000 miles of trail within Alameda and Contra Costa County, the District has extensive knowledge and expertise in trail design, maintenance and operation. Recognizing the District's interest in the successful completion of Oakland's waterfront trail and the project's compatibility with the District's existing facilities at Martin Luther King Jr. Regional Shoreline and plans for expansion of the SF Bay Trail, the District believes a coordinated effort between the City and the District is essential for the success of the project. From reviewing the project description in the DEIR, it appears that details are yet to be worked out for the final trail design, alignment, and trail maintenance/

cont.

operation. The District requests that the City coordinate these details with the District as the project proceeds to design stages of development. The District's comments on the DEIR are related to these concerns and are as follows: **1 cont.**

Trail Design Specifications:

The DEIR does not provide sufficient detail for the design of the proposed trails to determine compatibility with existing segments of the Bay Trail (DEIR, P-52). In the absence of detailed design specifications for each new segment of trail, there could be a potential design conflict between the proposed future trails and their connections with existing trails. Acknowledging that these details cannot necessarily be worked out in the DEIR, to avoid this potential conflict, the District recommends that the City set forth design standards in the DEIR that will ensure trail design compatibility with existing trail specifications of the District and Bay Trail. The DEIR acknowledges that intergovernmental coordination for open space planning with East Bay Regional Park District is an adopted policy under the City's Open Space, Conservation and Recreation (OSCAR) General Plan Element (OSCAR, Policy OS-6.1). The District's trail details and Bay Trail Design Guidelines would be appropriate design standards to reference to ensure the compatibility of the future trail with existing trails. Coordination with the District on the final design of these trail segments will also ensure compatibility of the new segments of trail with existing trails. To facilitate this coordination, the City should engage the District early in the trail development and design process and submit plans for review by the District prior to commencing construction. **2**

Continuous Bay Trail:

Acquisition of land and construction of trail segments to complete the SF Bay Trail along the Oakland Estuary and establishment of a continuous waterfront parkway are identified as project objectives (DEIR page 25). Figures III-10a and III-10b which are meant to show the project area for waterfront trail and access improvements (Group 2 projects), do not show a continuous path resulting from completion of the project. Specifically, there appears to be gaps between:

1) Livingston Pier to the Cryer Site;
2) Park Street Bridge to Derby Avenue;
3) US Audio/Capture Technologies to High Street Bridge;
4) Gallagher & Burk/Hanson Aggregate to East Creek point.

3

In order to demonstrate that the project is consistent with the project objectives, the EIR should include a graphical exhibit / map that shows how the project will result in a continuous waterfront parkway. The graphic should provide sufficient detail to inform the public of thetype of trail (Class I, II or III) and note whether it is existing or part of the proposed project. Known gaps in the trail should be identified so as to not confuse the public as to where future segments of the Bay Trail are still missing.

Letter
A5
cont.

Hanson Aggregate Interim Connection:

The District currently operates and maintains the segment of the SF Bay Trail located south of the Hanson Aggregate property to 66th Avenue / Martin Luther King Jr. Regional Shoreline and previously commented on the Notice of Preparation for the project that it was exploring the possibility of a non-motorized bicycle and pedestrian route connecting the Bay Trail to High Street via Tidewater Avenue. The District is still exploring this as an option for the interim alignment of the SF Bay Trail.

The District supports Oakland's efforts in continuing the Bay Trail along the shoreline at the Gallagher & Burk/Hanson Aggregate trail segment. Recognizing this alignment may not be feasible in the short term, the District would like to see the Tidewater Avenue alignment considered as an interim route for the continuation of the SF Bay Trail northward as briefly mentioned in the project description (DEIR p. 57) and alternatives analysis (DEIR p. 359) of the DEIR. The final alignment for this trail segment will require a trail configuration which does not adversely affect operations of the Gallagher & Burk/Hanson Aggregate facility. **4**

Trail Maintenance:

Expansion of trails and enhancement of facilities will result in more intense use by the public versus pre-project conditions even though the project will not directly cause an increase in population. Trail user safety issues arising from poorly maintained trails are foreseeable indirect impacts of the park/trail expansion and should be a factor in evaluating applicable policies adopted by the City for ensuring that parks are adequately maintained for the safety of its users. Foreseeable hazards may include the presence of loose gravel & fallen debris; cracks; potholes; rough surfaces; flooding/drainage issues; lifting/sinking of trail surfaces; overgrown vegetation constraining the width of the trail & obstructing site visibility; and vandalized/broken bollards & security gates/fencing allowing for vehicular access to the trail.

The City's Open Space Conservation and Recreation (OSCAR) element of the General Plan identifies policies and action items that, if implemented, would ensure that parklands/trails are properly maintained. Implementation of these policies and action items would ensure that the new park/trail improvements will not deteriorate over the life of the project and pose a safety hazard to users. The City has adopted the following policies for the purpose of ensuring public safety for users of the Parks/Trail facilities, and for this reason, the District believes are relevant in the DEIR's analysis of applicable policies: **5**

1. Action REC-1.5.1: Adoption of a citywide park plan (OSCAR p. 4-32) - *A Parks and Recreation Master Plan is needed to guide decisions regarding the delivery of services and programs, and the expenditure of funds for operations, maintenance, and capital improvements.*

2. Policy REC – 4.1: Systematic Maintenance Provisions (OSCAR p. 4-46) - *Provide for ongoing, systematic maintenance of all parks and recreational facilities to prevent*

Letter
A5
cont.

deterioration, ensure public safety, and permit continued public use and enjoyment. Routine maintenance needs should be evaluated on a regular basis. Parks which receive very heavy use should receive more frequent maintenance than those with lesser use.

3. Action REC-4.1.1: Priority on maintenance - *Establish an annual budgeting process within the Office of Parks and Recreation which assigns a very high priority to park maintenance.*

4. Action REC-4.1.2: Improvements which reduce maintenance costs - *Undertake improvements and upgrades at Oakland parks which reduce annual maintenance costs. Physical hazards arising on trails and park facilities are typically a result of deferred maintenance which is directly tied to City funding/resource allocation.*

5 cont.

The above policies, if properly implemented, would address any indirect physical change in the environment that may occur from the project with respect to trail hazards resulting from deferred maintenance of the proposed improvements. The DEIR should give the status of the implementation of these policies/actions and using these policies, provide for long-term funding for maintenance of the trails to avoid potential hazards to trail users. This will help the DEIR provide information to the public to enable it to understand and evaluate potential indirect environmental impacts associated with insufficient levels of service for maintenance of the new facilities.

The District is pleased that the City of Oakland shares in its vision to close the gaps in the SF Bay Trail along the Oakland shoreline and looks forward to working cooperatively with the City on making this project a success. Thank you for the opportunity to review and comment on the DEIR and the City's consideration of the District's comments. If you have any questions or comments, please contact me at (510) 544-2627.

6

Sincerely,

Chris Barton
Senior Planner
Environmental Review/GIS Department

cc: Brad Olson, Environmental Programs Manager
Jim Townsend, Trails Program Development Manager

Letter A5
East Bay Regional Park District
Chris Barton, Senior Planner
September 5, 2007

Response A5-1: This introductory statement to the Park District's comment letter identifies the District's interest in the proposed Waterfront Trail component of the Measure DD Implementation Project. The Park District requests that the City coordinate these details with the District as the project proceeds to design stages of development. The comment is noted.

Response A5-2: The comment requests that the District's trail details and Bay Trail Design Guidelines be used as design standards to ensure compatibility of the future trail with existing trails. The comment also notes that the City has an adopted policy in its Open Space, Conservation and Recreation (OSCAR) General Plan Element that encourages intergovernmental coordination for open space planning with the Park District. The comments regarding design criteria and intergovernmental coordination do not address the Draft EIR's environmental analysis or identify a new impact of the project. These comments will be considered by City of Oakland decision-makers during review of the merits of the project.

Response A5-3: As the comment notes, the purpose of the figures is to show the project area for the Waterfront Trail Group of the Measure DD Implementation Project. The "gaps" between the project areas are either complete or will be completed by others. The segment of trail between the Lake Merritt Channel and the 10th Avenue Marina is the only incomplete portion of the trail outside of the project area. It will be completed as part of the Oak to 9th Project, as shown on Figure III-10a. The trail is already complete at the other locations cited by the comment, that is, from the Livingston Pier to the Cryer Site, from the Park Street Bridge to Derby Avenue, from U.S. Audio Technologies to High Street and from the Gallagher & Burk/Hanson Aggregate property to 66th Avenue. The text of the Draft EIR is revised to clarify the status of the various segments of the Waterfront Trail outside of the limits for the Measure DD Implementation Project. Figures III-10a and III-10b are revised as shown on the following pages. The text on page 52 of the Draft EIR is revised as follows:

a. General Trail Characteristics. Most of the 6.6 miles of trail would be paved with asphalt or concrete, with minimal grading so as to minimize disturbance of the ground surface. At some locations, invasive exotic plants, such as *Spartina*, would be removed if present along the shoreline. Control measures for *Spartina* would include those approved by the San Francisco Estuary Invasive Spartina Project. Some portions of the existing Bay Trail between Jack London Square and 66th Avenue may be repaired to fix broken pavement, lighting, or signage. The trail would vary from a minimum 12-foot-wide combined use trail where space is constrained to a pair of bike and pedestrian signage would be installed along the trail.

Oakland Measure DD
Waterfront Trail South

SOURCE: GOOGLE EARTH; LSA ASSOCIATES, INC., 2006
I:\RAJ0606 measure dd\RTC\RTC Figures\Fig_III10b.ai (11/5/07)

Some segments of the trail are already complete or will be completed as part of other projects. These segments include:

- Lake Merritt Channel to 10th Avenue Marina – segment will be completed as part of the Oak to 9th Project.
- Livingston Pier to Cryer Site – trail segment is complete
- Park Street Bridge to Derby Avenue – trail segment is complete
- U.S. Audio Technologies to High Street – trail segment is complete
- Gallagher & Burk/Hanson Aggregate to 66th Avenue Gateway – trail segment is complete, except for the northern-most portion

Response A5-4: The comment expresses support for completion of a portion of the Waterfront Trail in the vicinity of the Gallagher & Burk/Hanson Aggregate facility, either as described in the project description or, as an interim measure along Tidewater Avenue as described in the alternatives analysis. The comment is noted and will be considered by City of Oakland decision-makers during review of the merits of the project.

Response A5-5: Section B, Planning Policy, of the Draft EIR discusses how goals and policies from the City's General Plan are considered during the environmental review of the project. Goals related to recreation are presented in this section of the Draft EIR on page 93; relevant policies are presented in Appendix D.

The comment is correct in that the project would result in more intense use of trails by the public than the pre-project condition and that implementation of the City's policy for maintaining parks and recreational facilities would address any indirect physical change in the environment that may occur from the project with respect to trail hazards resulting from deferred maintenance. The project is not in conflict with this policy. Although the Measure DD funds would not be used for ongoing repair and maintenance, some funds would be used for renovating existing trails and other recreational facilities, which would reduce the need for maintenance in these areas over the short and mid-term. Future maintenance funds would be derived from the City's general fund and the Landscape Lighting and Assessment District.

As recommended by the comment, the text of the EIR is revised as follows to include the policy from the City's Open Space Conservation and Recreation (OSCAR) General Plan Element with regards to maintenance:

Policy Rec-4.1	**Systematic Maintenance Provisions.** Provide for ongoing, systematic maintenance of all parks and recreational facilities to prevent deterioration, ensure public safety, and permit continued public use and enjoyment. Routine maintenance needs should be evaluate on a regular basis. Parks which receive very heavy use should receive more frequent maintenance than those with less use.	*Lake Merritt and Lake Merritt Channel:* The project provides funding to renovate the Boathouse, Pergola, 18th Street Pie, which are consistent with the long-term upkeep of parks and recreational facilities. *Waterfront Trail:* The project provides funding to renovate existing trails as well as to construct new trails. *Recreational Facilities:* The project provides funding to renovate Studio One. *City-wide Creeks:* N.A.

Consistency with the many goals and policies in the City's General Plan will be considered by the City of Oakland decision-makers during review of the merits of the project.

Response A5-6: The comment states that the Park District supports the City's vision to close gaps in the Waterfront Trail. The District's support for this element of the project is appreciated and will be considered by City of Oakland decision-makers during review of the merits of the project.

City of Oakland
Community and Economic Development Agency
250 Frank H. Ogawa Plaza, Suite 3315
Oakland, CA 94612

ALA000223
SCH#2006122048

Dear Ms. Thornton:

Case No. ER 06-0017: Measure DD Implementation Project – Draft Environmental Impact Report

Thank you for continuing to include the California Department of Transportation (Department) in the environmental review for the proposed project. The comments presented below are based on the Draft Environmental Impact Report (DEIR) for the project referenced above. 1

The Department on behalf of Union Pacific Railroad is proposing to relocate one of the existing railroad bridges over the Lake Merritt Channel. This relocation is proposed to replace the rail capacity that will be impacted by a proposed nearby freeway project.

Traffic Impact Analysis

The document did not include a Traffic Impact Analysis or supporting technical documentation for project trips; thus we are unable to verify traffic conditions discussed in the DEIR. It is unclear how much traffic would be generated or distributed, and to which streets, and how much this traffic would contribute to the cumulative impact. The reconfiguration of local streets has significant impacts to ramp intersections regardless of trip generation. 2

We are concerned about the designation as "significant and unavoidable" for the impacts of Group 1 (Pages 137, 138, Impacts TRANS-5 through TRANS-9). The intersections named are either ramp intersections or adjacent intersections. The cost to widen these intersections and/or acquire right-of-way (ROW) should be considered since there are other significant projects included in the "cumulative plus project conditions" that should also be able to contribute fair share funds to mitigate these impacts. 3

Given the significant impact at the 7th Street and Oak Street intersection, we are also concerned about the ramp intersections at 6th Street and 5th Street. The impact to these intersections should be analyzed. 4

Letter
A6
cont.

The proposed sports complex will be located adjacent to Interstate 880 and the 98th Avenue interchange; what is the impact to the ramps and intersections? **5**

Cultural Resources

The Cultural Resources section in the DEIR is well done and satisfies environmental compliance for cultural resources within state ROW. However, if construction activities take place within State ROW during this project and there is an inadvertent archaeological discovery, the Department's Office of Cultural Resource Studies shall be immediately contacted at (510) 286-5618. A staff archaeologist will evaluate the finds within one business day after contact. **6**

Encroachment Permit

Any work or traffic control within the State ROW requires an encroachment permit that is issued by the Department. Traffic-related mitigation measures will be incorporated into the construction plans during the encroachment permit process. See the following website link for more information: http://www.dot.ca.gov/hq/traffops/developserv/permits/

To apply for an encroachment permit, submit a completed encroachment permit application, environmental documentation, and five (5) sets of plans which clearly indicate State ROW to the address at the top of this letterhead, marked ATTN: Michael Condie, Mail Stop #5E. **7**

Should you have any questions regarding this letter, please call Lisa Carboni at (510) 622-5491.

Sincerely,

TIMOTHY C. SABLE
District Branch Chief
IGR/CEQA

c: State Clearinghouse

Letter A6
California Department of Transportation (Caltrans)
Timothy Sable, District Branch Chief
September 10, 2007

Response A6-1: The comment regarding the California Department of Transportation's (Caltrans) proposed replacement of the Union Pacific Railroad (UPRR) bridges over the Lake Merritt Channel as part of a proposed nearby freeway project does not raise a specific issue regarding the environmental analysis in the Draft EIR so no further response is provided.

Response A6-2: The comment states that the document did not include a Traffic Impact Analysis or supporting technical documentation for project trips. Only the Recreational Facilities (Group 3) element of the project would generate automobile travel in the traditional sense. Trip generation for Group 3 is shown in Table IV.C-9 on page 143 of the DEIR. The number of auto trips for Group 3 was calculated for AM and PM peak weekday conditions and for Saturday peak conditions. Because of the characteristics of Group 1 and Group 2 elements of the project, no analysis of trip generation was required to provide a traffic impact analysis.

The Lake Merritt and Lake Merritt Channel (Group 1) element of the proposed project would affect transportation systems as a result of the changes proposed in travel lanes and roadway geometry around Lake Merritt. Group 1 was evaluated by comparing the results produced by the Alameda Countywide Travel Demand Model for the existing roadway configuration against the proposed changes in the roadway configuration. No-project traffic volumes were modified to account for the changes in traffic patterns predicted by the travel demand model. A quantitative traffic impact analysis resulting from the changes in traffic patterns associated with Group 1 components is documented in the Draft EIR on pages 122 through 140.

The Oakland Waterfront Trail and Access (Group 2) would close gaps along the San Francisco Bay Trail between Jack London Square and 66th Avenue in East Oakland and would not affect traffic operations on other transportation systems. Group 2 is not expected to change automobile travel demand but required the assessment of potential impacts on transportation systems where the trail may cross existing streets. A qualitative evaluation of Group 2 impacts was documented on pages 140 to 141.

In response to the comment that it is unclear how much traffic would contribute to the cumulative impact, all traffic volumes for cumulative conditions with and without the Group 1 element of the project are documented in Appendix E and the contribution to the cumulative impact is provided on pages 133 through 140.

In response to the comment that the reconfiguration of local streets has significant impacts to ramp intersections regardless of trip generation, the impacts of the Group 1 element of the project on ramp intersections was disclosed by the analysis of the following intersections, which are all connected to I-580 ramps:

- Santa Clara Avenue / Grand Avenue
- Macarthur Boulevard / Grand Avenue
- Lake Park Avenue / Lakeshore Avenue
- Macarthur Boulevard / Lakeshore Avenue

The traffic analysis in the Draft EIR concluded that traffic shifts caused by the proposed project would not significantly affect other freeway ramps.

Response A6-3: The comment incorrectly states that Impacts TRANS-5 through TRANS-9 were found to be significant and unavoidable. Impacts TRANS-5 through TRANS-7 were found to be significant and unavoidable; Impacts TRANS-8 and TRANS-9 were found to be significant but can be reduced to less-than-significant levels with the recommended mitigation measures. The comment states that the City should consider obtaining fair share funds from other projects that contribute to the impacts. The City is aware that other projects contribute to the impacts at the intersections and will pursue all appropriate methods of funding. The source(s) of project funding does not fall under the purview of CEQA and is not within the purview of this response document.

Response A6-4: Although the comment expresses concern that ramp intersections at 6th and 5th Streets (at I-880) might be significantly impacted, the analysis showed that traffic volumes on 7th Street south of Oak Street would not be affected (as shown by comparing the traffic volumes shown in Appendix E – Figures A.3 and A.4).

Response A6-5: In response to the question about the impact of the proposed sports complex to the ramps and intersections near I-880, the analysis was performed at a program level using the methods appropriate for a CMP analysis, as stated on page 143 of the Draft EIR. Roadway links on I-880 and local streets were evaluated and impacts were found to be less than significant. No intersection or ramp analysis was performed. The Draft EIR disclosed that I-880 would operate at LOS F during the peak hour but that the addition of sports complex traffic would not be significant. Similarly, the link level of analysis found that the sports complex would not have significant impacts on local streets.

Response A6-6: The comment provides contact information for Caltrans' Office of Cultural Resources in the event there is an archaeological discovery within State right of way during Measure DD Implementation Project construction activities. The City appreciates the contact information and will notify Caltrans as required when working within State right of way.

Response A6-7: The City will obtain necessary encroachment permits from Caltrans and appreciates the information describing Caltrans resources that are available to assist with the permit process.

RE: Measure DD Implementation Project, SCH# 2006122048

Dear Ms. Thornton:

There are some very serious problems that do need to be addressed regarding bicycle and pedestrian circulation in the vicinity of Lake Merritt channel near the UP tracks. The DEIR suggests that an at-grade crossing may be one alternative, however, UP and CPUC staff would adamantly oppose an at-grade crossing. Without a grade separated crossing near the channel, pedestrians and cyclists will most likely use the 5th Avenue at-grade railroad crossing, which is not designed to accommodate non-motorists, and even with significant upgrades would still be a hazardous location for pedestrian and bicycle traffic. **1**

The above-mentioned safety improvements should be considered when approval is sought for the new development. Working with Commission staff early in the conceptual design phase will help improve the safety to motorists and pedestrians in the County.

If you have any questions in this matter, please call me at (415) 703-2795.

Very truly yours,

Kevin Boles
Environmental Specialist
Rail Crossings Engineering Section
Consumer Protection and Safety Division

cc: Terrel Anderson, Union Pacific Railroad

Letter A7
California Public Utilities Commission (PUC)
Kevin Boles, Environmental Specialist
August 31, 2007

Response A7-1: The comment states that the California Public Utilities Commission and the Union Pacific Railroad (UPRR) oppose an at-grade crossing of the UPRR tracks in the vicinity of the Lake Merritt Channel and that without a grade separated crossing at this location, pedestrians and cyclists would likely use the 5th Avenue crossing. The comment claims that the 5th Avenue crossing is hazardous and suggests a grade separated crossing near the channel or safety improvements at the 5th Avenue crossing. The proposed bicycle and pedestrian connections between I-880 and the Oakland Estuary are not part of the proposed project and no at-grade crossing in the vicinity of the Lake Merritt Channel is proposed. Streetscape improvements to 5th Avenue, not part of the Measure DD project, are in the initial planning stage, and could potentially include safety improvements at the existing at-grade crossing.

The trail along the Lake Merritt Channel currently ends south of the 7th Street Bridge and this would not change as part of the project. On the east side of the Channel the trail merges into the parking lot south of the Peralta College District offices; on the west side of the Channel, the trail passes under I-880 and connects to the dead end of 4th Street. Bicycle and pedestrian access to the estuary from the Downtown and Lake Merritt areas of Oakland would continue to be served by 5th Avenue, Oak Street (currently a bike route, Class 3), or other connections in the vicinity of Jack London Square. Both 5th Avenue and Oak Street are identified as proposed bike lanes (Class 2) in the City's proposed 2007 Bicycle Master Plan. The rail line crossings at these locations currently include safety features (i.e., automatic gates and flashing signals) and further improvements to the crossings (e.g., striped lanes and signage) would be included as part of other projects to upgrade these bicycle connections.

The Draft EIR acknowledges that several issues would need to be resolved before a crossing of the railroad tracks along the Lake Merritt Channel is implemented, including agreements with UPRR and the Public Utilities Commission. The resolution of improving trail connectivity in this area is not part of the Measure DD Implementation Project, as noted on page 129 of the Draft EIR. Completion of the trail connection along the channel would likely require subsequent environmental review once a project is defined. The City will work with UPRR and the Public Utilities Commission to ensure the safety of pedestrians and bicyclists should a new crossing of the UPRR tracks be proposed.

To clarify where the trail would end south of 7th Street, the text on pp. 35-36 of the Draft EIR is revised as follows:

As part of the Measure DD Implementation Project, the City proposes to widen the Channel, streambed, stream banks and upland areas between Lake Merritt and the Estuary by removing the 10th Street culvert and 12th Street culvert (discussed above) and grading the Channel's banks, thus creating additional areas of open water and tidal marsh as shown in Figure III-4. The bottom of the channel at 12th Street would be lowered. Shoreline improvements (e.g., pedestrian pathways and tidal marsh) along the channel between 12th Street and I-880 would be similar in design to those ~~to the designs~~ proposed for the 12th Street project component. The existing pedestrian bridge below 10th Street would be refurbished or replaced. At 7th Street, the pedestrian tunnel on the east side of the trail would be refurbished and the pedestrian tunnel on the west side would be relocated to allow construction of the new bypass channel. A new traffic signal and crosswalk across 7th Street is proposed. The 7th Street project component proposes the creation of a bypass channel to improve recreational access, as well as to allow large fish to once again enter the upper Lake Merritt Channel and Lake Merritt. The trail south of 7th Street would be refurbished but would otherwise remain unchanged. On the east side of the Channel the trail merges into the parking lot south of Peralta College District offices; on the west, the trail passes under I-880 and connects to the dead end of 4th Street.

The City will ~~is proposing to~~ remove some existing trees (approximately 58) along the channel as shown in Figure III-5. Invasive exotic plants, such as *Spartina*, would be removed if present along the shoreline and new intertidal and upland plantings consisting of native plants such as pickleweed (lower marsh areas), marsh gumplant, and salt grass (upper marsh areas and transitional zones characterized by native grasses), and shrubs and trees would be planted to restore the natural ecosystem of the Channel. Control measures for *Spartina* would include those approved by the San Francisco Estuary Invasive Spartina Project. The City also is proposing to install biofiltration basins to improve water quality. Typical construction activities would include clearing, grading, excavating, pile driving, and replanting of landscaping using various pieces of construction equipment and by hand labor. ~~This reconfiguration would include the continuation of pathways established as part of the 12th Street and 10th Street project components, the improvement of pedestrian tunnels under 7th Street, and the installation of a new traffic signal and crosswalk across 7th Street. The 7th Street project component proposes the creation of a bypass channel to improve recreational access, as well as to allow large fish to once again enter the upper Lake Merritt Channel and Lake Merritt.~~

Subject: MEASURE DD, LAKE MERRITT & PROPOSED BAY TRAIL

Ms. Thornton:

We completed our preliminary review of the DEIR for the subject project.
Proposed navigational impacts were not adequately addressed. When the applicant begins working with the Coast Guard for Bridge Permitting issues, the environmental document, as drafted, with be inadequate for our use. **1**

Attached is a .pdf of our previous correspondence on the topic.

Thank you,
David H. Sulouff
Chief, Bridge Admin

City of Oakland
Attn: Elois A. Thornton
250 Frank Ogawa Plaza, Suite 3315
Oakland, CA 94612

Dear Madam:

Please include the Coast Guard Bridge Office concerning the Measure DD Environmental Impact Report (EIR) Project, for all bridge related issues over existing or proposed navigable waters of the United States. **2**

The General Bridge Act of 1946 requires that the location and plans for bridges over navigable waters of the United States be approved by the Commandant, U. S. Coast Guard prior to commencing construction. The Oakland Inner Tidal Canal and the Oakland-Alameda Estuary are considered to be navigable waterways of the United States for bridge administration purposes. Coast Guard Bridge permitting is subject to the National Environmental Policy Act. **3**

Lake Merritt and the portion of Lake Merritt Channel upstream from the impoundment are presently not considered navigable for bridge permitting purposes. However, alteration of the waterway to allow vessels to navigate between the lake and the estuary would result in a change to the determination and existing or proposed bridges would become subject to Coast Guard Jurisdiction. **4**

Applications for bridge permits should be addressed to Commander, Eleventh Coast Guard District, Bridge Section, Bldg 50-2, Coast Guard Island, Alameda, CA 94501. Applications are available on-line at: http://www.uscg.mil/hq/g-o/g-opt/g-opt.htm. The application must be supported by sufficient information to permit a thorough assessment of the impact of the bridges and their immediate approaches on navigation and the environment. We recommend discussing the proposed impacts of procedures for constructing, altering or demolishing bridges. The Environmental Impact Statement should also contain data on the number, size and types of vessels using or projected to use the waterway. **5**

We appreciate the opportunity to comment on the project in this early stage. I can be contacted by telephone at (510) 437-3516 if additional information is needed.

Sincerely,

David H. Sulouff
Chief, Bridge Section
Eleventh Coast Guard District
By direction of the District Commander

Letter A8
United States Coast Guard
David H. Sulouff, Chief, Bridge Section
September 7, 2007

Response A8-1: The City considered the project's design features and the operation of the bridges when determining whether the project would create a safety hazard or impede marine transportation. As noted on page 56 of the Draft EIR, to the extent feasible, the undercrossings of bridges along the Waterfront Trail would not extend beyond the existing pierhead line. The trail would remain as close to the existing bridge abutments as possible to ensure public safety and not impede navigation. Further, the bridge undercrossings would not impede marine transportation or create a significant safety hazard because to allow passage of marine vessels at High and Park streets, both the north and south ends of the bridges are raised, with marine vessels passing through the opening near the midpoint of the Tidal Canal. At Fruitvale Avenue, the south end (Alameda side) of the bridge is raised, with marine vessels passing through the opening south of the midpoint of the Tidal Canal. The proposed trail undercrossing would be beneath the fixed northern section (Oakland side) of the Fruitvale Bridge, which remains lowered during vessel passages. Thus, the City concludes that the proposed design of the bridge undercrossings would allow adequate room for the passage of marine vessels and would not create a safety hazard for pedestrians and bicyclists or impede marine shipping. See Photoplate 1 on the following page, which show the bridges in the open position during the passage of marine vessels.

However, the City recognizes that the U.S. Coast Guard and the shipping community have concerns about the potential safety and feasibility of the proposed under-bridge segments of the Waterfront Trail, particularly at the High Street and Park Street bridges, and that the U.S. Coast Guard has permitting authority in this area. For this reason, and others, the City proposes to pull the proposed boardwalk closer to the shore at the High Street and Park Street bridges, so that the channel is not narrowed any further. Also the City proposes an alternative to the project that does not include the passage of the Waterfront Trail beneath the bridges. That alternative is described and analyzed in Section V.F of the Draft EIR (pp. 356-359).

To clarify the City's conclusions regarding safety and shipping in the Oakland Channel the text on page 142 of the Draft EIR is revised as follows:

Traffic <u>and Maritime</u> Hazards. Implementation of the proposed project would result in the Bay Trail passing under the bridges. Therefore, the project would not result in any significant impacts related to traffic hazards as the trail would not conflict with vehicular circulation. <u>To the extent feasible the proposed trail segments that would pass beneath the Park Street and High Street bridges would not extend further into the channel than the existing bridge fenders. At all bridges, trail segments would be kept as close to the shoreline as necessary to ensure public safety and not impede</u>

Photoplate 1: Barge Passage along the Oakland Inner Harbor Tidal Canal

Alameda side — Park Street Bridge — Oakland side

Oakland side — Fruitvale Bridge — Alameda side

Alameda side — High Street Bridge — Oakland side

navigation. However, the U.S. Coast Guard and others have raised concerns about the potential safety and feasibility of a trail being constructed under the bridges, particularly the High Street and Park Street bridges. Recognizing that the U.S. Coast Guard has permitting authority in these areas, the City includes street-level crossings in these areas as part of the alternative for the Waterfront Trail Group, described in Section V.F, Waterfront Trail Surface Street Connection Alternative.

The comment also resubmits comments made when the Notice of Preparation was issued. While these comments are not specific to the Draft EIR, as they were submitted in advance of its publication, they are nevertheless addressed by Responses to Comments A8-2 through A8-5.

Response A8-2: Copies of the Draft EIR and the Notice of Availability were sent to Mr. Sulouff as part of the noticing process for the EIR. Refer also to Response to Comment B4-1.

Response A8-3: The comment regarding the permitting authority of the U.S. Coast Guard is noted. The City understands that the U.S. Coast Guard must comply with the requirements of the National Environmental Policy Act (NEPA) and will work with the U.S. Coast Guard to prepare the required documentation, as needed.

Response A8-4: The comment regarding the effect of the proposed action on the U.S. Coast Guard's jurisdiction over areas upstream of 7th Street is noted. As the comment does not relate to the environmental analysis within the Draft EIR so no further response is provided.

Response A8-5: The City appreciates the information provided in the comment for obtaining and completing U.S. Coast Guard bridge permit applications and the contents of the permit application and supporting NEPA documentation. The City will prepare the required applications and work with the U.S. Coast Guard to prepare NEPA documentation, as needed.

Re: Measure DD Project DEIR (Case No. ER 06-0017)

Dear Ms. Thornton:

This letter sets forth the comments of the Golden Gate Audubon Society (GGAS) on the above-referenced Draft Environmental Impact Report (DEIR). The (GGAS is an environmental advocacy organization with members both in Oakland as well as throughout the larger Bay Area. One of the GGAS's principal purposes is the protection and enhancement of wildlife habitat for avian species, particularly migratory waterfowl.

The Lake Merritt/Lake Merritt Channel complex supports migratory waterfowl habitat of regional significance. The project that the City proposes to carry out with the support of Measure DD funding will in general enhance the natural resource and habitat values of the Lake Merritt aquatic system. Accordingly, as we stated in our letter dated January 4, 2007 (a copy of which is reproduced in Appendix C of the DEIR), which we submitted in response to the NOP for this environmental review, the GGAS is in general strongly supportive of the projects described in the DEIR.

In the GGAS's letter in response to the NOP, we identified two respects in which the projects described in the DEIR have the potential to degrade or otherwise have an adverse impact on the regionally significant waterfowl habitat that the Lake Merritt Channel (LMC) supports: 1) noise, movement of heavy construction equipment, and other construction-related disturbances associated with the implementation of proposed improvements at the 7th, 10th and 12th street crossings of the LMC, and 2) disturbance associated with the opening of the LMC to small boat traffic. We called upon the City to carefully evaluate these potential impacts and develop appropriate mitigation measures to minimize them. **1**

We are pleased to see that in § IV.F.2.c(4) (p. 217) the DEIR proposes a mitigation measure (Impact BIO-4 (Group 1)) in the form a seasonal closure of the LMC to small boat traffic in order to minimize the adverse effects on the LMC's wildlife habitat that such traffic might otherwise cause. We recommend that the measure be clarified by specifying that the "small boat use" of the LMC that would be allowed **2**

Letter
B1
cont.

during the non-migratory season is limited to nonmotorized use. With this clarification, we fully concur in this measure. **2 cont.**

However, we disagree with the reasons that the DEIR gives for its conclusion that construction-related impacts on the LMC's wildlife habitat are "less than significant." The DEIR correctly acknowledges that "construction activities at the LMC (e.g., grading, demolition of existing culverts, tree removal) during [the period when waterbirds are most abundant (approximately October through March)] would disturb waterbirds by causing them to fly away…." The DEIR further acknowledges that such disturbance "negatively affects wintering ducks by causing the expenditure of energy…that would otherwise be used for behaviors necessary for survival, such as resting or feeding." The DEIR's conclusion that such effects are "less-than-significant" because the affected wildlife can simply "relocate to nearby areas," is inconsistent not only with the DEIR's own analysis of the effects of human disturbance on waterfowl, but also with the "work window" for pile driving (Impact BIO-2 (Group 2)) that the DEIR recommends to avoid the adverse impacts that such activity would otherwise have on fish habitat in the Oakland Estuary. At least in the absence of evidence that adoption of one or more similar "work windows" for the Measure DD-funded projects in or adjacent to the LMC is infeasible, the GGAS believes that adoption of such measures is called for. **3**

Thank you for your consideration of these comments. Please send future notices to the GGAS in care of me at my home address: 1433 Hampel St., Oakland, 94602.

Sincerely,

John Bowers

John Bowers
Member, East Bay Conservation Committee

LETTER B1
Golden Gate Audubon Society
John Bowers, Member, East Bay Conservation Committee
September 7, 2007

Response B1-1: This introductory statement expresses an opinion on the merits of the project and notes that the project will in general enhance the natural resource and habitat values of the Lake Merritt aquatic system. The Society's support for these elements will be considered by City of Oakland decision-makers during review of the merits of the project. The comment also identifies issues raised in the Society's comments on the Notice of Preparation. Refer to Responses to Comments B1-2 and B1-3.

Response B1-2: The comment recommends restricting small boat use of the Lake Merritt Channel to non-motorized vessels during the non-migratory season. As this restriction is not required to mitigate a significant effect of the project the measure is not included as mitigation. However, the Society's recommendation will be considered by City decision-makers during review of the merits of the project.

Response B1-3: The Draft EIR's analysis of impacts is consistent. When determining whether the project would have an adverse effect on wildlife species, the City considered both the intensity and duration of the project activity. In the case of migratory fish that may be present in the Oakland Estuary, potential exposure to the percussive sound waves produced by pile driving, although brief, could injure or kill protected fish species. Thus, the risk of injury or death is high and mitigation is recommended. On the other hand, pile driving in the Lake Merritt Channel may temporarily displace migratory waterbirds to other nearby areas of suitable habitat but the birds are not at risk of being injured or killed by the activity. Thus, the Draft EIR did not find this to be a significant adverse effect.

California Oak Report

Oaks & Climate Change

California Attorney General Edmund G. Brown, Jr. (AG) has reached a landmark lawsuit settlement with San Bernardino County involving the extent to which the County's environmental impact report for its General Plan update should address impacts on climate change. This is the first time any California jurisdiction has entered into a legally binding agreement to look at the overall impact of its planning on global warming.

The agreement solidifies climate change as an impact to be addressed in California Environmental Quality Act (CEQA) environmental review documents. Significant impacts to oak woodlands must be addressed in CEQA green house gas reviews because oak impacts uniquely combine carbon capture and carbon emission issues.

According to the AG, discretionary approvals must provide: (1) An examination of a project's impact on climate change and the adoption of all feasible mitigation measures to reduce such impacts, and (2) such analysis can – and must – be done today even absent established thresholds of significance or impending regulations under Assembly Bill 32. The state's California Climate Action Registry, which will guide AB 32 regulations, recognizes that converting oak woodlands to development is a carbon emission due to lost forest photosynthesis. Moreover, many municipal and county codes have general or specific tree-related provisions that reference air quality, air pollution or climatic conditions.

Consistent with the CEQA opinions of the AG, where significant oak resource impacts occur, project air quality analyses must consider three oak resource factors: (1) How much carbon is sequestered in the impacted oak trees?; (2) How much potential carbon sequestration will be lost due to oak seedling, sapling and tree impacts?; (3) How much sequestered carbon will be released if the impacted oaks are burned?

The CEQA Oak Woodlands Dilemma

The oak woodlands circumstances are unique for each CEQA project. Unfortunately, project oak woodland mitigation measures consistently fail to provide proportional habitat mitigation. The basic problem is a failure to see the forest for the trees, exemplified by the fact that invariably mitigated negative declarations and environmental impact reports biologically analyze oak woodlands but mitigate for individual oak trees.

<u>On-Site Conservation Easement Mitigation</u>

Impact avoidance through on-site oak woodlands conservation easement serves only to limit the degree of significant oak woodland impacts and the project applicant's oak woodlands mitigation responsibilities. An on-site oak preserve amounts to nothing more than a promise not to further remove or fragment the remnant oak resource; these preserves do nothing to proportionally mitigate for the actual impacts from removing project site oak habitat.

Placement of an oak woodlands easement within a development is of marginal habitat value and also creates a potentially hazardous fire condition. Residual or planted oaks are at great risk of future loss through new Cal Fire fuel reduction regulations and increasingly stringent fire insurance policy standards.

ABSTRACT

Scattered trees are prominent features in many landscapes worldwide, including natural landscapes, cultural landscapes, and recently modified landscapes. The ecological importance of scattered trees is widely acknowledged in natural landscapes, but has not been sufficiently appreciated in human-modified landscapes. This paper shows that scattered trees are keystone structures in a wide range of landscapes. At the local scale, ecological functions of scattered trees include: provision of a distinct microclimate; increased soil nutrients; increased plant species richness; increased structural complexity; and habitat for animals. At the landscape scale, ecological roles include: increased landscape-scale tree cover; increased connectivity for animals; increased genetic connectivity for tree populations; and provision of genetic material and focal points for future large-scale ecosystem restoration. Furthermore, in disturbed landscapes, scattered trees often are biological legacies that provide ecological continuity through time. In combination, these ecological functions support the argument that scattered trees are keystone structures. That is, their contribution to ecosystem functioning is disproportionately large given the small area occupied and low biomass of any given tree, and the low density of scattered trees collectively. Because scattered trees fulfill unique functional roles in a wide range of scattered tree ecosystems, their loss may result in undesirable ecological regime shifts. A key management challenge in all landscapes with scattered trees is to maintain a balance between recruitment and mortality of trees in an appropriate spatial pattern. Meeting this challenge may represent an important step towards the genuine integration of conservation and production in human-modified landscapes.

> *"The way things look is not always the way things are. This fact should be cause for consternation among those who are interested in the management of ecological systems. A highly functional landscape structure may go unnoticed - even by people who depend upon its function"* (Nassauer, 1992, p. 239).

1. Introduction

Ecosystems with scattered trees occur throughout the world. The origins and ecological roles of scattered trees in natural ecosystems have been intensively studied in many parts of the world, including in the Brazilian Cerrados (Furley, 1999),

Venezuelan Trachypogon savanna (San José et al., 1991), African savannas (Belsky, 1994), arid rangelands in South Australia (Facelli and Brock, 2000), oak savannas in North America (Nuzzo, 1986) and the forest-tundra transition zone of the boreal forest (Sirois, 1992). Scattered trees are also prominent features of many human-dominated landscapes, including recently cleared landscapes in Central America (Guevara et al., 1992), Africa (Duncan and Chapman, 1999) and temperate Australia (Ozolins et al., 2001), well-established cultural landscapes such as the dehesas in Spain and Portugal (Díaz et al., 1997) or British wood-pastures (Peterken, 1996), and severely disturbed forest landscapes (Gibbons and Lindenmayer, 2002). In this paper, these systems are collectively referred to as "scattered tree ecosystems". This definition is intended to be broader than that of "savanna" (sensu Bray, 1960), and includes natural, cultural and recently modified, as well as disturbed and undisturbed ecosystems (Fig. 1). The key defining feature of scattered tree ecosystems is the dispersed pattern of the trees. Scattered trees are referred to by various synonyms in different areas, including isolated trees (Dunn, 2000), pasture trees (Otero-Arnaiz et al., 1999), paddock trees (Law et al., 2000), and remnant trees (Guevara et al., 1986).

In this paper, scattered tree ecosystems are categorized into three groups for the purposes of discussion: (1) natural (such as savannas), (2) cultural (such as wood-pastures), and (3) recently modified (such as remnant paddock trees in south-eastern Australia) (Fig. 1). The distinction between cultural and recently modified scattered tree ecosystems is that the former have a long-term history of manipulation by humans and have been sustained by cultural systems over a long period of time. In contrast, the latter are recently modified, and often highly modified, and levels of tree cover are often declining. In reality, the distinction between the three categories will be blurred, and both natural and cultural scattered tree ecosystems can be highly modified. Similarly, levels of human modification and natural disturbance often interact, and scattered tree ecosystems therefore occur on a continuum from natural through to recently modified.

Despite large differences in climate and origin, scattered trees in natural, cultural and recently modified landscapes share many key ecological roles as well as several threats to their continued existence. However, especially in modified landscapes, the ecological value of scattered trees has rarely been recognized. The aims of this paper are to:

(1) demonstrate the keystone role of scattered trees;
(2) synthesize key ecological functions of scattered trees and highlight parallels between natural, cultural and recently modified ecosystems;
(3) establish common threats to scattered trees, especially in human-dominated landscapes; and
(4) outline ways in which scattered trees might serve as a landscape management tool to integrate conservation and production in human-modified landscapes.

By outlining the similarities between scattered trees in natural, cultural and recently modified ecosystems, this paper aims to facilitate increased recognition of the importance of scattered trees in modified landscapes. It is argued that native scattered trees exert a disproportionate effect on ecosystem function in a wide range of ecosystems, and that their loss therefore may lead to the deterioration of important ecosystem functions.

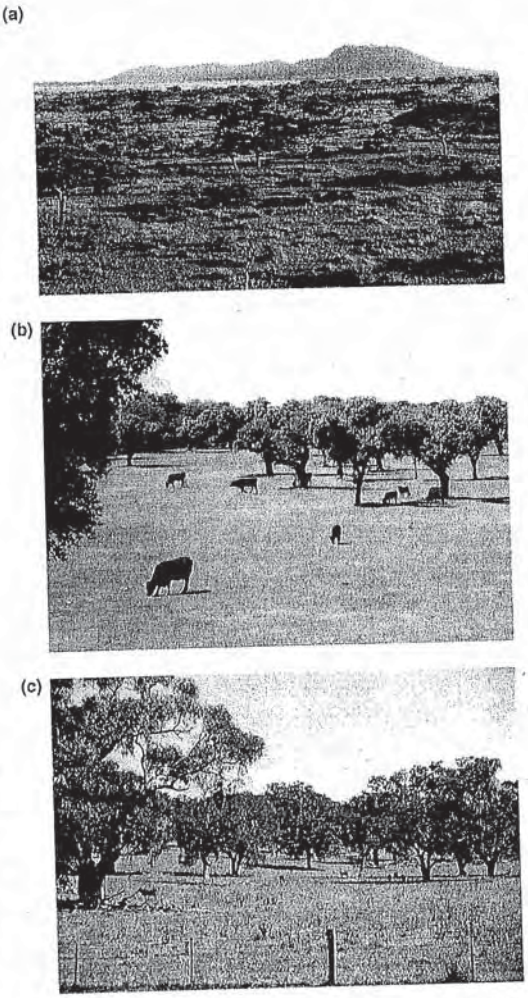

Fig. 1 – Three landscapes with scattered trees, representing a continuum of alteration states: (a) a natural landscape in southern Africa (top; photo by R. Heinsohn), (b) a cultural landscape in southern Spain (middle; photo by D. Gilmour, copyright IUCN), and (c) a recently modified landscape in south-eastern Australia (bottom; photo by A. Manning).

2. Scattered trees are keystone structures

A large amount of evidence demonstrates a wide range of important ecological functions of scattered trees in many natural, cultural, and recently modified landscapes (reviewed in detail below). In various different ecosystems, several authors

Letter
B2
Attach A

have independently noted the "keystone" role of scattered trees, for example, in the Negev desert in Israel (Munzbergova and Ward, 2002), and in dehesas in Spain (Plieninger et al., 2003). Tews et al. (2004a,b) considered scattered trees in African savannas as "keystone structures" because:

> *"[A] wide array of species groups (e.g. arthropods, birds or mammals) depend on [scattered] trees as a food resource, shelter or nesting site. Consequently, overall species diversity is strongly linked to the quality of this structure"* (Tews et al., 2004a, p. 87).

Given many parallel functions of scattered trees across a broad spectrum of vastly different ecosystems, native scattered trees should be recognized as keystone structures in a wide range of landscapes, including natural, cultural and recently modified landscapes. Furthermore, some traditional agroforestry systems using non-native and domesticated tree species can also have important ecological and socio-cultural values (see Herzog, 1998, regarding the European "Streuobst" agroforestry system where fruit trees are undersown with crops or managed grassland). Analogous to the keystone species concept (reviewed by Power et al., 1996), scattered trees are keystone structures because they have a disproportionate effect on the ecosystem relative to the small area occupied and low biomass of any given tree and the low density of scattered trees collectively. It is precisely because scattered trees are not part of a large consolidated patch, that their local and landscape effects are pronounced. In an ecosystem otherwise dominated by ground cover vegetation, a single scattered tree will add a raft of additional or enhanced functions (Fig. 2). In contrast, when part of an existing large patch of trees, the addition of a single tree is less likely to add new functions not already fulfilled by other existing trees.

To maintain functioning ecosystems, it is widely recognized that priority should be given to species that fulfill unique functional roles rather than functionally redundant species (Walker, 1992; Elmqvist et al., 2003). The raft of roles fulfilled by scattered trees suggests that the notion of functional uniqueness should be extended beyond species to include structural features, such as scattered trees. Given the lack of alternative features that could fulfill similar ecological functions to scattered trees, the ability of scattered tree ecosystems to maintain their essential characteristics directly depends on the ongoing existence of scattered trees. Scattered trees are threatened in many modified landscapes (see below). These threats, in combination with the functional uniqueness of scattered trees, suggest that many scattered tree ecosystems are in a precarious state (for example, British wood-pasture, Kirby et al., 1995). That is, their resilience to further disturbance is low, and they are at risk of undesirable regime shifts (for discussions of precariousness, resilience and regime shifts see Folke et al., 2004; Walker et al., 2004). In the following section, various ecological functions of scattered trees are outlined which support the argument that scattered trees are keystone structures.

3. Functions of scattered trees

In natural, cultural and recently-modified landscapes, scattered trees fulfill many functions. The following sections

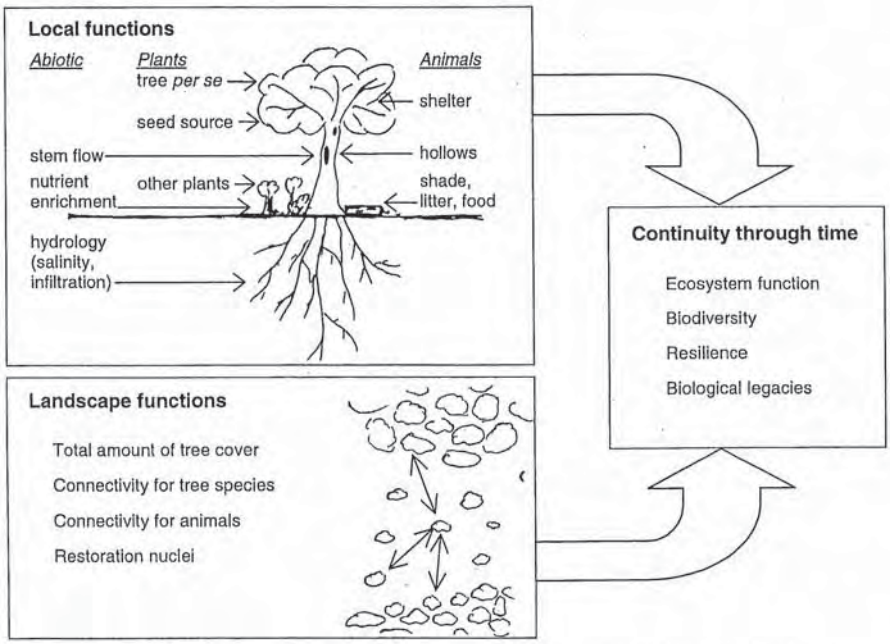

Fig. 2 – Schematic summary of some key ecological functions of scattered trees.

Table 1 – Examples of direct benefits from scattered trees to humans in modified landscapes

Benefit	References
Provision of ecosystem services (sensu Daily, 1997) which are essential for farming	This paper
Provision of fruit in many tropical landscapes	Aguilar and Condit (2001)
Wood products like firewood, fence posts and charcoal	Joffre et al. (1999), Pulido et al. (2001)
Shade and sheltered grazing for livestock	Kirby et al. (1995), Harvey and Haber (1999), Reid and Landsberg (1999), Quelch (2002)
Fodder for livestock in Britain	Peterken (1996)
Preservation of family traditions and real estate values in dehesas	Plieninger et al. (2004)
Recreational value for walkers and hunters in Scotland	Kirby et al. (1995), Quelch (2002)

consider: (1) the local-scale ecological functions of individual trees, (2) their role as biological legacies in modified landscapes, and (3) landscape-scale ecological functions of multiple scattered trees. In addition, examples of direct benefits from scattered trees to humans are given in Table 1.

3.1. *Local-scale ecological functions of scattered trees*

At the local scale, a given scattered tree influences its abiotic environment as well as plant and animal life (Fig. 2). Local changes to the abiotic environment are widely documented in natural, cultural and recently modified landscapes throughout the world, including the dehesas (Joffre et al., 1999), African savannas (Dean et al., 1999), and Australian rangelands (Facelli and Brock, 2000). Typical changes involve a cooler and often wetter microclimate under a given tree due to the interception of radiation and precipitation (Mistry, 2000). Stem flow, water uptake through the root system from below and around the tree, and increased infiltration of water into the soil further enhance the concentration of water near a given tree, especially in otherwise dry environments (Vetaas, 1992; Eldridge and Freudenberger, 2005).

Scattered trees also contribute to a local increase of nutrients, as demonstrated in dehesas (Joffre and Rambal, 1993), in south-eastern Australia (Wilson, 2002), the Brazilian Caatinga (Tiessen et al., 2003), and African savannas (Belsky, 1994). Nutrient levels under scattered trees are typically enhanced by litter accumulation, animal dung, the interception of nutrients by trees, and the accumulation of nutrients by tree roots (Wilson, 2002; Dean et al., 1999; Prober et al., 2002). Many scattered trees in dry savannas form symbiotic relationships with *Rhizobium* bacteria, thereby fixing atmospheric nitrogen and making it accessible to plants (Vetaas, 1992). By increasing the local water balance and nutrient concentration, scattered trees can enhance primary productivity (Ludwig et al., 1999).

Numerous benefits to plant life originate from scattered trees. The most basic benefit to plant diversity is the presence of scattered trees themselves. In recently modified ecosystems, scattered trees often represent samples of the original, pre-modification vegetation, and therefore provide important conservation opportunities in their own right (see Section 3.2). In central American modified landscapes, scattered trees are often represented by more than 50 species (Guevara et al., 1992; Harvey and Haber, 1999; Otero-Arnaiz et al., 1999; Aguilar and Condit, 2001), and in temperate Australia many scattered trees are the remnants of threatened vegetation communities like white box-yellow box-Blakely's red gum woodlands (*Eucalyptus albens/E. melliodora/E. blakelyi*; Gibbons and Boak, 2002). The conservation values of scattered trees per se also has been noted in the Brazilian Cerrados (Furley, 1999), the dehesas (Díaz et al., 1997), and British wood-pastures (Peterken, 1981, 1996; Kirby et al., 1995). Some scattered tree systems, such as dehesas, can have relatively few tree species (*Quercus ilex* and *Q. suber*), but still have high conservation value (Díaz et al., 1997).

Many other plant species typically benefit from the presence of scattered trees. For example, dehesas provide habitat for 30% of vascular plants in the Iberian peninsula (Pineda and Montalvo, 1995). Both in natural savanna landscapes (San José et al., 1991) and human-modified landscapes like in Central America (Guevara et al., 1992) or eastern Australia (Toh et al., 1999), scattered trees often function as "nurse plants" or "fertility islands", in that they provide favorable conditions for the recruitment of other plants (San José et al., 1991; Facelli and Brock, 2000). Plant species richness is typically higher under scattered trees than in the surrounding landscape, as demonstrated in Central America (Guevara et al., 1992), the Negev desert in Israel (Munzbergova and Ward, 2002), arid Australia (Facelli and Brock, 2000), and temperate Australia (Prober et al., 1998).

Scattered trees also are used by a wide range of animals throughout the world, in natural, cultural and recently modified scattered tree ecosystems. The micro-ecosystem surrounding an individual tree greatly enhances structural complexity relative to its surrounds. A wide variety of birds has been documented as using the canopies of scattered trees, for example, in Australia (Law et al., 2000; Fischer and Lindenmayer, 2002a), Central America (Guevara and Laborde, 1993; Harvey and Haber, 1999; Luck and Daily, 2003), southern Africa (Dean et al., 1999), and central Africa (Duncan and Chapman, 1999). Insectivorous bats in Australia forage around the canopy of scattered trees (Law et al., 1999, 2000; Lumsden et al., 2002; Lumsden and Bennett, 2005), and frugivorous bats make extensive use of scattered trees in many tropical landscapes (Duncan and Chapman, 1999; Galindo-González et al., 2000; Galindo-González and Sosa, 2003). A wide variety of canopy invertebrates has been recorded in Australia (Majer and Recher, 2000), and a range of ground-dwelling invertebrates have been documented below scattered trees within the dry, semi-deciduous forest zone in Ghana (Dunn, 2000) and under paddock trees in south-eastern Australia (Oliver et al., 2006). Cavities in scattered trees are used by a variety of birds,

mammals, reptiles and amphibians, as documented in Australia (Saunders et al., 1982; Gibbons and Lindenmayer, 2002; Manning et al., 2004a) and southern Africa (Dean et al., 1999).

3.2. *Scattered trees as biological legacies*

In landscapes that have been disturbed by natural processes or human activities, scattered trees play an important role as "biological legacies" (Elmqvist et al., 2002). Biological legacies are organisms or organically derived structures that persist after a disturbance (Franklin et al., 2000). Biological legacies have several functions including: representation of tree species per se (see above); assisting other species to persist (the so-called "life-boating" function, sensu Franklin et al., 1997); providing habitat for recolonization of a site (structural enrichment); influencing patterns of ecosystem recovery (nucleation); providing a source of energy and nutrients for other organisms; and stabilization of environmental conditions (reviewed by Lindenmayer and Franklin, 2002).

The concept of "nucleation" is used to describe the spreading of recovery from many different foci following a disturbance (Franklin and MacMahon, 2000), and is a particularly important function of scattered trees. In recently disturbed ecosystems, scattered trees can act as "regeneration nuclei" (Guevara et al., 1986). This can be in the form of seed directly from the trees (Cascante et al., 2002; Elmqvist et al., 2002), or indirectly from seeds deposited in droppings by organisms attracted to the trees, such as birds and bats (Guevara et al., 1986; Elmqvist et al., 2002). Scattered trees can therefore function as focal points for future restoration activities (Otero-Arnaiz et al., 1999; see below). Despite reduced genetic variability, the reproductive potential of scattered trees remains high in some landscapes (Cascante et al., 2002), and scattered trees represent potential sources for large-scale natural regeneration of Australian woodlands (Dorrough and Moxham, 2005) and Central American rainforests (Galindo-González et al., 2000). Natural regeneration is a substantially cheaper and ecologically preferable form of restoration than tree planting (McIntyre, 2002; Spooner et al., 2002). The "fertility island" effect of scattered trees (see above) further enhances their ability to act as central points of ecosystem recovery from which plant succession may radiate outwards into other parts of a given landscape (Toh et al., 1999).

Scattered trees are often the oldest living structures in disturbed landscapes and provide important ecological continuity through time. Ironically, although scattered tree ecosystems, such as wood-pastures, are often not regarded as "proper forest" (Rackham, 1998), they can provide refuges for organisms associated with original "natural" forest. For example, wood-pastures in Britain contain structures, species, and communities which are relicts of past management systems as well as original natural forest (Peterken, 1981, 1996; Kirby et al., 1995). Trees in British wood-pastures can live between 300 and 500 years and provide habitat for fungi and invertebrates associated with decaying wood and epiphytes largely absent in other forest types (Peterken, 1981, 1996; Alexander, 1999). Similarly, retained trees in recently logged boreal forests provide habitat continuity for lichen species that are directly dependent on these trees (Hazell and Gustafsson, 1999). Furthermore, in many human-modified ecosystems, scattered trees pre-date the era of tree planting and preserve local tree genotypes (Kirby et al., 1995).

3.3. *Landscape-scale ecological functions of scattered trees*

In addition to the local-scale ecological functions of a given individual scattered tree, in combination, multiple trees scattered throughout a landscape provide additional ecological functions (Fig. 2). The most obvious landscape-scale function of scattered trees is that they contribute to the overall amount of tree cover in a landscape. The density of trees is of considerable scientific and conservation interest in natural landscapes (Jeltsch et al., 1996; Mistry, 2000). Perhaps more importantly, scattered trees make an important contribution to overall tree cover in many cultural and recently modified landscapes. Recently modified ecosystems such as grazing landscapes in temperate Australia (Gibbons and Boak, 2002) and tropical Central America (Galindo-González et al., 2000) often contain a large proportion of their total remnant tree cover as scattered trees or small clumps of trees.

Tree cover is important for many animal species, and low amounts of tree cover in previously forested landscapes may lead to cascades of extinctions as a result of the simultaneous loss of the amount of unmodified vegetation and landscape connectivity (Andrén, 1994). Despite its modified status, a landscape mosaic characterized by scattered trees often provides habitat for a range of animal species, including birds and bats in both Central America (Guevara and Laborde, 1993; Galindo-González and Sosa, 2003) and south-eastern Australia (Law et al., 2000; Fischer and Lindenmayer, 2002a,b). A key feature of landscapes with scattered trees is that their connectivity remains relatively high for some animals (Guevara and Laborde, 1993; Graham, 2001; Fischer and Lindenmayer, 2002b).

Landscapes dominated by scattered trees can provide valuable foraging habitat for some animal species. For example, lichen forest in the forest-tundra transition zone of the boreal forest in Quebec may represent a large reservoir of forage for large caribou (*Rangifer tarandus*) herds (L. Sirois, pers comm.). Some species of bats and birds that use scattered trees for foraging are important seed dispersers. In tropical modified landscapes, frugivorous bats play a particularly important role in dispersing primary and secondary rainforest plants (Duncan and Chapman, 1999), thus increasing plant genetic connectivity and population viability (Cascante et al., 2002). The survival of bats in these landscapes therefore is considered key to future forest recovery (Galindo-González et al., 2000). Other mutualists of trees, such as pollinators, have been studied less extensively in modified landscapes (but see Ricketts et al., 2004). However, the general notion that a loss of landscape connectivity may result in the disruption of mutualist relationships in fragmented landscapes is well established (Cordeiro and Howe, 2003), and it is reasonable to expect that scattered trees will at least somewhat improve connectivity for a wide range of mutualist species.

More generally, scattered trees enhance landscape heterogeneity (the horizontal patchiness) of landscapes. For modified landscapes, it is widely accepted that other things being equal, increased landscape heterogeneity tends to increase landscape scale species richness (Benton et al., 2003; Luck and Daily, 2003).

In previously densely vegetated landscapes, scattered trees contribute to the "softening" of the matrix surrounding more discrete vegetation remnants (Lindenmayer and Franklin, 2002). Structural contrast at edges is widely acknowledged to result in a cascade of abiotic and biotic changes, ultimately leading to synergistic changes in both plant and animal life (Ries et al., 2004; Harper et al., 2005). Scattered trees reduce the structural contrast between patch edges and the matrix, and therefore reduce the likelihood and intensity of negative edge effects.

4. Threats to scattered trees

Scattered trees in natural, cultural and recently modified landscapes face some similar threats, as well as some threats that are unique to particular ecosystems. The most direct threat to all scattered trees is clearing by humans. For example, the legal and illegal removal of scattered trees is widespread in Australian grazing landscapes (Gibbons and Boak, 2002). Similarly, widespread land clearing continues in some Central American landscapes (Aguilar and Condit, 2001).

A slower, but equally problematic, threat to scattered trees is the lack of natural regeneration. Recruitment failure is often related to high grazing pressure, and may be a problem in natural, cultural and recently modified landscapes with scattered trees. Reduced recruitment of scattered trees has been reported in African savannas (N. Van Rooyen, unpublished data, cited in Jeltsch et al., 1996), Central American farming landscapes (Harvey and Haber, 1999; Graham, 2001), dehesas (Pulido et al., 2001), British wood-pastures (Kirby et al., 1995), and temperate Australian grazing areas (Spooner et al., 2002; Saunders et al., 2003). In the latter, the lack of recruitment threatens the persistence of scattered trees across vast areas of the wheat-sheep zones in eastern and Western Australia. In these landscapes, scattered trees without any younger generations of trees are "the living dead" (sensu Janzen, 1988). Because many scattered trees are dying of old age, a recent study in eastern Australia estimated a narrow window of opportunity spanning only a few decades in which large-scale tree regeneration will be possible (Dorrough and Moxham, 2005).

Some scattered tree ecosystems can be threatened by vegetation encroachment. For example, in many natural dry savannas, overgrazing can lead to shrub encroachment with often detrimental consequences for native species (Meik et al., 2002). In dry savannas, the negative impacts of livestock grazing are often exacerbated by changed fire regimes and strong rainfall events, leading to the invasion of thickets of unpalatable shrubs (Milton et al., 1994; Tews et al., 2004b). Maintaining appropriate grazing pressure is also important in British wood-pastures to sustain trees and open grassy areas in the same location (Kirby et al., 1995). In wood-pastures, both too much and too little grazing can be a threat. If there is too much grazing, trees do not regenerate; if there is too little grazing, open wood-pastures turn into denser forest ecosystems (Peterken, 1981, 1996).

These examples highlight that although the effect of grazing can vary, appropriate grazing regimes are pivotal to the continued existence of many ecosystems characterised by scattered trees. Determining what constitutes an appropriate grazing regime is not straightforward, and depends on the particular ecosystem under investigation. In many cases, choices need to be made about which species are in most urgent need of conservation attention. For example, Martín and Lopez (2002) found that lizard abundance in dehesas increased with dense understory vegetation. However, dense understory vegetation decreased the quality of hunting habitat for the endangered Spanish imperial eagle (*Aquila adalberti*).

Salinity can be an additional threat to scattered trees in both natural and human-dominated dry ecosystems. Scattered trees contribute to maintaining the ground water table at naturally low levels (Stirzaker et al., 2002). The removal of scattered trees, in turn, can lead to a rising ground water table, which can bring naturally occurring salts to the surface. The widespread removal of trees in temperate Australia has led to large-scale salinity problems, which now threaten both biodiversity and agricultural productivity (Saunders and Hobbs, 1995). Similar mechanisms also have led to increased salinity in some natural ecosystems such as the Negev desert in Israel (Munzbergova and Ward, 2002).

More generally, scattered trees may be threatened by poor tree health. In the Mediterranean, the tree root pathogen *Phytophthora cinnamomi* is causing a severe decline of oak species (*Quercus* spp.) (Plieninger et al., 2003). In Australia, rural dieback of eucalypts, where trees are severely defoliated, is leading to large-scale and premature tree death (Landsberg and Wylie, 1983). It is caused by complex interactions between numerous biotic and abiotic factors, including land management practices (Landsberg, 1990). In the United Kingdom, debarking by the introduced grey squirrel (*Sciurus carolinensis*) threatens the long-term persistence of wood-pastures (Mountford and Peterken, 2003).

Finally, land use intensification poses a threat to scattered tree ecosystems. In the Iberian dehesas, regeneration failure of oak has been exacerbated by recent agricultural intensification (Díaz et al., 1997; Pulido et al., 2001) and urban development (Plieninger et al., 2004). In Australia, scattered trees are more likely to be lost in cropping landscapes than in grazing landscapes (Ozolins et al., 2001). In addition, removal of fallen deadwood and standing dead trees for firewood (Driscoll et al., 2000) and the "tidying" of pastures by farmers (Reid, in litt.) can threaten the continued existence of key structural elements. Similar threats have been reported in British wood-pastures. Here, the removal of fallen deadwood and standing dead timber has eliminated mature habitat in many places, and recreation pressures such as car parks, heavy trampling and removal of dangerous branches at iconic locations, and vandalism are important threats to the long-term persistence of wood-pastures (Kirby et al., 1995; Peterken, 1996).

5. Scattered trees and landscape management

5.1. *Landscape management approaches*

One of the great challenges in landscape management is the trade-off between meeting short-term human needs and

maintaining the capacity to provide ecosystem services in the long term (Foley et al., 2005). There is a growing debate about the best way to manage landscapes in the face of growing human populations and associated demand for food. This debate has recently been framed as a trade-off between two approaches: "land sparing" versus integrated landscape management (Green et al., 2005; Mattison and Norris, 2005). Land sparing occurs where higher yielding parts of the landscape are intensively farmed to reduce pressure for more farmland. Integrated landscape management (also known as wildlife-friendly farming, sensu Green et al., 2005) is where native species are maintained across entire production landscapes (Green et al., 2005).

While land sparing may be attractive in theory (Green et al., 2005), it may be unsustainable in practice. First, there is no guarantee that land sparing will reduce forest loss because greater farm productivity can induce additional clearance to further increase profitability (Simon and Garagorry, 2005). Second, there is no guaranteed link between intensification in one place and reservation in another. Third, high productivity areas are most likely to be targeted for intensification, but are usually already the least reserved and most modified (Braithwaite et al., 1993; Lindenmayer and Franklin, 2002). Furthermore, the density of many organisms is skewed towards the most productive parts of landscapes (Braithwaite, 1983). Fourth, land sparing can result in the separation of commodity production and non-production areas, which ignores the interdependence of the two and the interaction of pattern and process in landscapes. Fifth, the consequences for long-term sustainability from land sparing are unknown because of potential lag effects on organisms and ecosystem processes arising from landscape consolidation. Sixth, land use intensification often eliminates key landscape elements, such as scattered trees, that obstruct machinery and intensive farming practices (Maron, 2005).

As a consequence of these issues, it may be difficult to differentiate the practical on-ground outcomes of land sparing from the traditional transition of land use, seen throughout human history, towards greater intensification and ecosystem fragmentation (sensu Saunders et al., 1991; McIntyre and Hobbs, 1999; Foley et al., 2005). As discussed above, land use intensification is a major threat to scattered tree ecosystems around the world. Evaluation of land sparing and consolidation of native ecosystems as land management options should first consider their possible shortcomings, and their potential effects on keystone structures such as scattered trees.

5.2. *Scattered trees and integrated landscape management*

Integrated landscape management attempts to reconcile conservation and production in the same landscape (sensu Hobbs and Saunders, 1991), and is practiced in many cultural scattered tree ecosystems, such as the dehesas or British wood-pastures. In integrated landscapes formerly covered by forest or woodland, scattered trees can be used as a useful landscape management tool which can complement conservation reserves and consolidated blocks of remnant vegetation.

Agroforestry, which is defined as "an intimate mixture of trees with farm crops and/or animals on the same piece of land" (Savill et al., 1997, p. 234), is a good example of how scattered trees can be used as a landscape management tool. Agroforestry has significant potential to achieve conservation goals in agricultural landscapes (Harvey et al., 2004; Salt et al., 2004) and lies at the intersection between agriculture and forestry. Both dehesas and wood-pastures are examples of agroforestry.

Some techniques from forestry also offer useful insights on the benefits of integrating scattered trees in landscapes over the long term. The notion of biological legacies (see above) underpins the technique of "green tree retention" which is increasingly being used in boreal forest management (Vanha-Majamaa and Jalonen, 2001). With green tree retention, a certain number of trees are retained permanently after harvesting to mimic conditions after a moderate-intensity natural disturbance (Vanha-Majamaa and Jalonen, 2001; Lindenmayer and McCarthy, 2002). The main purposes of green tree retention are:

- the "life-boating" of species and processes after logging as tree cover is re-established;
- the enrichment of re-established stands with structural elements; and
- the enhancement of landscape connectivity (Franklin et al., 1997).

Green tree retention can maintain canopy continuity, preserve old and large trees and maintain habitat and structural diversity. There are two spatial patterns of green tree retention. First, in "dispersed retention" retained structures are distributed evenly throughout the harvest unit. This form of retention is also useful for dispersing mitigating effects (such as modification of microclimate, hydrology or soil stabilization through roots) over the whole stand (Franklin et al., 1997; Lindenmayer and Franklin, 2002). Second, in "aggregated retention" small patches are retained to be representative of the original stand conditions and to provide intact understory and soil organic layers. Unlike dispersed retention, effects of this approach are confined to the immediate area around the retained patch (Franklin et al., 1997; Lindenmayer and Franklin, 2002). Green tree retention thus contributes to a continuum of possible forest management options, and represents one end which explicitly recognizes the value of scattered trees.

The principles underpinning agroforestry and green tree retention have implications for the management of existing scattered tree ecosystems and formerly wooded and forested landscapes. Variable retention harvest systems (which include green tree retention as a component) provide "a continuum of structural retention options" (Franklin et al., 1997, p. 115). The idea of a continuum of landscape management options, from consolidated patches through to areas of scattered trees offers a promising approach to landscape management. As a practical approach to managing landscapes, this would be highly compatible with recent developments in the area of landscape concepts. Scattered trees do not fit well into schematic "patch-matrix-corridor" landscape models which categorize landscapes either "habitat" or "non-habitat" (McIntyre and Hobbs, 1999; Manning et al., 2004b). This is

because they occur in what is generally considered the "matrix". It is now recognized that many landscapes have habitat that is modified, but not destroyed ("landscape variegation" sensu McIntyre and Hobbs, 1999). It is also recognized that vegetation often occurs in spatial continua and habitat boundaries are often indistinct or gradual (McIntyre and Hobbs, 1999; Manning et al., 2004b). Further, different organisms perceive and respond to the same landscape differently (the Continua- *Umwelt* concept, Manning et al., 2004b). This paper demonstrates that many organisms consider scattered trees as important habitat. The maintenance and expansion of scattered trees across landscapes, and the use of techniques such as agroforestry and green tree retention, are highly compatible with these continua-based landscape concepts. It is thus possible to envisage future landscapes where consolidated conservation areas will be embedded within integrated, multi-use scattered tree ecosystems.

In grazing landscapes, such as those in temperate Australia, regeneration of scattered trees could be encouraged through techniques such as micro-restoration. The aim of micro-restoration is to facilitate the regeneration of saplings in the immediate vicinity (<30 m radius) of existing large scattered trees thereby maintaining the spatial pattern of scattered trees (Lindenmayer et al., 2005; Fig. 3). Methods for micro-restoration will be locally specific, and dependent on the specific mechanisms involved in the regeneration of particular tree species. However, methods might include encouragement of regeneration by placing small temporary fences around individual mature trees or groups of trees to exclude grazing, direct planting and seeding, soil scarifying or burning beneath existing trees. Notably, micro-restoration could be useful in complementing existing restoration programs which aim to establish large and consolidated patches of native vegetation (Bennett et al., 2000). Other management strategies might include reduced stocking rates or alternative grazing regimes (Jansen and Robertson, 2001; Spooner et al., 2002).

Future landscape management approaches, using a range of tree retention and regeneration techniques, would ideally recognize the complementary contributions of large patches of native vegetation and extensive areas of scattered trees, and provide a promising vision for genuine and sustainable integration of conservation and production.

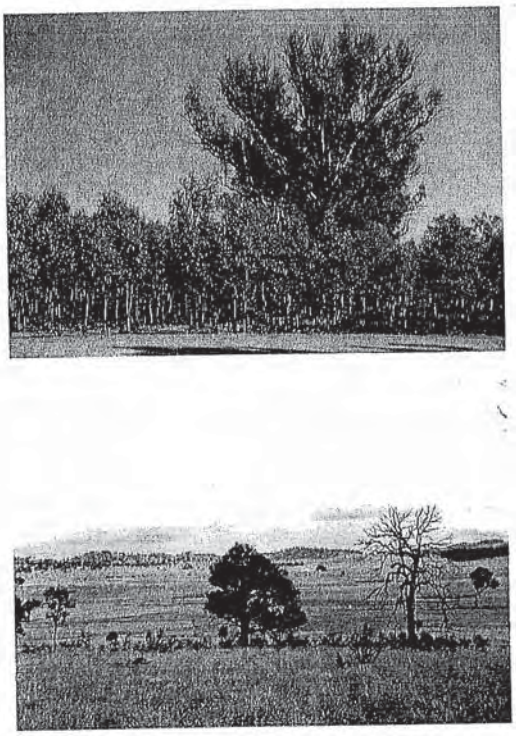

Fig. 3 – Micro-restoration is where tree regeneration is facilitated in the immediate vicinity (<30 m radius) of an existing scattered tree. These examples, from south-eastern Australia, show what micro-restoration might look like (top photo by D. Lindenmayer, bottom photo by A. Manning).

Oaks 2040: The Status and Future of Oaks in California

By Tom Gaman and Jeffrey Firman[1]

Introduction: Developing planning tools for oak futures in California

Ecological functions, wildlife habitat, recreational opportunities and scenic values are seriously impaired as population densities and other landscape use pressures increase. Managers of oak woodlands and forests need to balance the biological, sociological and economic interests of private landowners, public agencies, business, universities, environmental groups and concerned individuals. Planning must address the complexities of local, regional and state-wide oak issues within the context of practical on-the-ground land use decisions.

Oaks 2040 is based on objective oak data and is designed to serve decision makers who may develop local and regional Oak Woodlands Management Plans or advance other conservation strategies. A statewide map of oak distribution and a current forest and woodland inventory, created by state and federal researchers, were the starting points for Oaks 2040. From those, regional analyses of forest structure and oak types as well as region-specific oak inventory summaries have been developed. By evaluating these maps and inventories against current economic growth projections, Oaks 2040 identifies the location and extent of oaks most at risk.

Cover photo: Black Oak at Big Sur

[1] Tom Gaman tgaman@fforestdata.com and Jeffrey Firman jfirman@fforestdata.com of Forest Data, P.O. Box 276, Inverness, CA 94937. Gaman and Firman (see www.forestdata.com) have been active many years in forest inventory, data analysis, mapping and forest conservation. Both have master's degrees in forestry from Yale University. Gaman is a registered professional forester and a board member of the California Oak Foundation.

Citizens Concerned with Oak Conservation:

Oaks are more than a distinct component of the landscape for many of us who live in California. For hundreds of years, people have lived in, raised families under, and worked around these generous, natural and cultural icons. Today, increasing population pressures and poorly-planned development are threatening oak sustainability.

The Oak Woodland Conservation Act requires cities and counties to assess their wealth in oak resources and to adopt Oak Woodlands Management Plans in order to meet the need for healthy watersheds, clean air and water, and sufficient high quality wildlife habitat. These Plans must include a description of native oak species and their current and historical distribution, as well as existing threats, status of natural regeneration and urban growth trends. These Plans must also recognize the economic value of oak woodlands in their respective jurisdictions and encourage and support farming, ranching and grazing operations compatible with oak woodland conservation.

Oaks 2040 is designed to provide various stakeholders involved with developing or updating their community's Oak Woodlands Management Plan with current information on 48 of the 58 counties that contain significant oak resources. Every effort has been made to present this important information fairly.

Readers must realize, however, that COF is an advocate for sustainable oak resources. To that end, the full report mentions the importance of using available tools, such as acquisition in fee, conservation easements in perpetuity, deed restrictions and oak mitigation banks, in a timely fashion to achieve conservation of oak resources.

COF's Board of Directors thanks its members, associates and friends for their individual and collective efforts to establish a viable Oak Reserve system made up of well-managed oak woodlands and forests on private and public lands throughout California.

Sincerely,
Janet Santos Cobb

Methods

MAPPING OAK TYPES

A number of overall vegetation maps, maps of hardwoods in general, and oak-specific maps have been generated over the years. Currently, the most reliable statewide vegetation map available is the "LCMMP Vegetation Map" (FRAP map) produced by the California Department of Forestry and Fire Protection's Fire and Resource Assessment Program (FRAP) in conjunction with the US Forest Service (USFS) Region 5 Remote Sensing Lab (RSL) in Sacramento. While these maps do not focus specifically on oaks, oak habitat types can easily be extracted from these vegetation types. Using these maps as a foundation (supplemented by other earlier mapping efforts), species-specific range maps of oak types throughout the state (FRAP 2005) have been generated.

The FRAP map uses the *Calveg* classification system which first divides all vegetation into *Covertype*. Covertype can be equal to the following: conifer (CON), shrub (SHB), barren (BAR), hardwood (HDW), grass (HEB), water (WAT), conifer/hardwood mix (MIX), urban (URB), or agricultural (AGR). For finding oak habitat, only two *Covertypes* are relevant. All *woodland* classified as 'hardwood' (HDW) or *forest* classified as 'conifer/hardwood mix' (MIX) can potentially be oak habitat provided it contains the relevant hardwood species. All other *Covertypes* were eliminated from the analysis.

"The Oak Woodland Conservation Act requires cities and counties to assess their wealth in oak resources and to adopt Oak Woodlands Management Plans in order to meet the need for healthy watersheds, clean air and water, and sufficient high quality wildlife habitat."

After *Covertype*, the Calveg system also specifies *Vegtype*, which identifies the dominant species association. For both HDW and MIX covertypes, the data were screened to ensure that the hardwood associations being mapped in a particular location are oaks. Dozens of hardwood *Vegtypes* are mapped throughout the state, but only twelve are dominated by tree oaks. Nine of these are dominated by a single species, each forming its own Oak Habitat Type, or "Oak Type." Three heterogeneous hardwood types were combined to generate a "mixed" Oak Type. The ten resulting Oak Types, each potentially occurring in both "woodlands" and "forests"[2], are listed in the following Table 1:

This rigorous selection and reclassification process was applied to the FRAP maps. The results are GIS layers and maps depicting the distribution of woodland and forest oak habitat types throughout California. These geographic data provide the foundation for the landscape-level analysis of the distribution and diversity of California's oak woodlands and oak forests. See the tables in Appendix A for acres of cover where oaks dominate the woodland by county and Oak Type and acres of cover where oaks are present in the forest by county and Oak Type.

OAK TYPE	SCIENTIFIC NAME	TYPE(S)
Black Oak	*Quercus kelloggii*	QK
Blue Oak	*Quercus douglasii*	QD
Canyon Live Oak	*Quercus chrysolepis*	QC
Coast Live Oak	*Quercus agrifolia*	QA
Engelmann Oak	*Quercus engelmannii*	QN
Interior Live Oak	*Quercus wislizeni*	QW
Oregon White Oak	*Quercus garryana*	QG
Tanbark Oak	*Lithocarpus densiflorus*	QT
Valley Oak	*Quercus lobata*	QL
Mixed Oaks	not applicable	EX/NX/TX

Table 1. Oak Types

[2] "Oak Woodlands" are considered to be those mapped vegetation types where oaks dominate the landscape. By definition, they have at least 10% canopy cover. "Oak Forests" are those vegetation types dominated by trees, but *Quercus spp.* or *Lithocarpus densiflorus* may not necessarily be among the dominant species.

OWNERSHIP AND AT RISK ANALYSIS

Two additional layers are added to further intensify the oak mapping analysis. Land ownership and development risk layers are incorporated into the map to assess pertinent conservation issues. The land ownership data is courtesy of the California Department of Forestry's Forest and Rangeland Resources Assessment Program (FRAP 1999). Using the FRAP layer, the state is divided into a variety of public and private ownership categories. The statewide ownership layer overlaid on top of the Oak Type map reveals ownership patterns of California's oaks.

The development risk data has been derived from the California Department of Finance's projected development layer. This dataset is based on 2000 US Census Data (FRAP 2001). This layer tracks past development by decade and predicts future development through 2040. Using this information, three categories were defined. 'Developed' is defined as anything that has been developed (greater than 32 housing units per square mile) by 2000. 'At Risk' refers to anything that has not been developed by 2000 but is expected to develop by 2040. 'Stable' refers to anything that has not been developed by 2000 and is unlikely to be developed before 2040.[3] Once the layer was divided into these three categories, it was overlaid on top of the Oak Type Map. The oak woodlands of the state were thereby divided into groups by oak type, ownership and development risk.

INVENTORY AND ANALYSIS

The other critical element for assessment of mapped oak types is the inventory summary, which is based upon data obtained from the USFS Forest Inventory and Analysis Program (FIA). This statewide grid of permanent forest survey sample "plots" yields information about what the mapped oak forests and woodlands look like on the ground. The plots provide information not obtainable via remote sensing techniques – an inventory of forest fuels, species distribution, specific size, growth, regeneration, habitat features, pest and disease. With point-specific data ranging from species composition to seedling regeneration to tree size and density, these plots help one understand the makeup of each of the ten oak types.

The most recent FIA field data was obtained to provide an inventory of each of the oak types discussed above. Combining the ground-based survey data and the GIS mapping data enabled the authors to provide a comprehensive oak inventory using new vegetation maps and the 2001-2004 FIA inventory data.

Using conventional computer programs, inventory data was processed to produce summaries of each plot. The survey plots were grouped by oak type within each region and a customized program was used to produce inventory summaries per acre by oak type by region. Regional totals were then summed up to provide an inventory for the entire state. A variety of other factors were analyzed using the inventory data including basal area and tree counts per acre of oaks relative to total trees, size distribution, regeneration status, and determination of associated hardwood and conifer species. Appendix B summarizes these details for woodlands and forests statewide by oak type.

[3] The 'developed' and 'at risk' designations are assigned to privately owned lands only, as those held in public ownership are considered 'stable' with regard to development. However, publicly-owned lands do face other challenges such as poor oak regeneration and non-sustainable land management practices.

California oaks: the statewide analysis

To facilitate statewide analysis, California counties have been grouped into six distinct regions, each of which is discussed later in this report. In an attempt to represent the levels at which conservation policy is often decided, county boundaries have been utilized for this regional split (see Figure 1), rather than natural boundaries such as watersheds or bioregions.[4] The tables in Appendix B summarize inventory details for woodlands and forests statewide by oak type.

"The plots provide information not obtainable via remote sensing techniques – an inventory of forest fuels, species distribution, specific size, growth, regeneration, habitat features, pest and disease."

Figure 1 – California is divided into six regional groupings of counties.

[4] These are the same regions used in Bolsinger's 1988 *The Hardwoods of California's Timberlands, Woodlands, and Savannas*, except that the San Joaquin Valley has been separated from the rest of Southern California.

OAKS PLAY A MAJOR ROLE IN THE CALIFORNIA LANDSCAPE

California has approximately 8.5 million acres of oak woodland and 4.5 million acres of oak forest. These 13 million acres comprise more than one-eighth of the state's area (see Figure 2). The Sacramento and San Joaquin regions are home to more than half of California's oak woodland. Oak forests are concentrated in the North Coast and North Interior regions. California currently has approximately two billion oaks greater than 1" DBH. More than 800 million of these oaks are larger than 5" DBH.

California oaks are diverse. Blue oak is California's dominant oak species, representing more than one-third of the state's oak woodlands. Canyon, coast and interior live oak woodlands comprise approximately one-third of California's oak woodlands. Tanbark, black and canyon live oak forests account for more than 80 percent of California's oak forests.

In oak woodland, oaks comprise 60 percent of the total tree basal area, 67 percent of trees greater than 5" DBH and 37 percent of trees greater than 24" DBH. In oak forest, oaks comprise 18 percent of the total tree basal area, less than 24 percent of trees greater than 5" DBH and eight percent of trees greater than 24" DBH. Blue oak, Oregon white oak and, to a lesser extent, interior live oak, are regenerating poorly. Blue oak averages about one seedling per thousand square feet in woodlands, and less than one seedling (one foot or more in height) per two established oak trees. Not a single Engelmann oak or valley oak seedling was tallied on any of the 932 FIA plots.

OAKS 2040: FUTURE PROSPECTS FOR CALIFORNIA'S OAKS

More than one million acres of California's oak woodlands are developed and approximately 750,000 are at risk of development before 2040. Twenty percent of California's oak woodlands are facing rapid and increasing urbanization by 2040. The oak woodlands of the Central Valley and Sierra Foothills face the most immediate threats. Eighty percent of California's oak woodlands that are at risk of development are located in the Sacramento and San Joaquin regions. See Figure 3.

"More than one million acres of California's oak woodlands are developed and approximately 750,000 are at risk of development before 2040."

California Oaks: The Regional Analyses

This section provides regional summaries. Each regional description includes oak distribution, oak woodland, oak forest diversity and oaks at risk.[1]

[1]Appendix B summaries herein presented statewide are further detailed by region in the full report online at http://www.californiaoaks.org/Oaks2040.

North Coast Region

Counties included in this region are Del Norte, Humboldt, Mendocino and Sonoma.

OAK DISTRIBUTION

The North Coast Region has 1.3 million acres of oak woodland and 1.5 million acres of oak forest. In fact 35 percent of California's oak forest is found in the North Coast region, and oaks are present on 45 percent of the region's land (more coverage than any other region).

Mendocino County contains more than one-half of the region's oak woodland, but Humboldt and Sonoma counties also have significant stands. The North Coast's oak forests are found primarily within Humboldt and Mendocino counties.

In the North Coast region, there are 210 million oaks greater than 1" DBH and 110 million oaks greater than 5" DBH. Only the Central Coast tops the North Coast's two million oaks with DBH greater than 24".

NORTH COAST OAK DIVERSITY

The North Coast oak woodlands feature Oregon white oak, tanbark oak and mixed oak. Canyon live oaks and black oaks are also present, mixing in with Douglas-fir, madrone and bay. Oaks comprise approximately one-half of the basal area, trees/acre, and trees greater than 5" DBH/acre in white oak woodlands. In tanbark oak woodlands, *Quercus spp.* (true oaks) comprise less than 20 percent of the basal area, trees/acre, and trees greater than 5" DBH/acre, but when including tanbark oak *(Lithocarpus densiflorus)* oaks then comprise 48 percent of basal area and number of trees per acre.

In the North Coast's oak forests, tanbark oak is predominant. Associated species include Douglas-fir, redwood, madrone, bay, canyon live oak and black oak. In tanbark oak forests, oaks provide 42 percent of the basal area and more than half of total trees greater than 1" DBH.

OAKS AT RISK IN THE NORTH COAST REGION

In terms of ownership, 84 percent of the North Coast's oak woodlands are located on private property. Most of the remainder is owned by the USFS and various other federal government agencies. Private ownership of oak woodland increases moving southward, ranging from 40 percent in Del Norte County to 95 percent in Sonoma County. Eight percent of North Coast oak woodlands have already been developed and four percent are at risk of near-time development. Nearly 90 percent of the oak woodlands are reasonably stable for the time being.

Sonoma County has experienced the most urbanization with 20 percent of oak woodlands developed and 10 percent at risk. Oak woodland development rates are relatively low in Del Norte and Humboldt counties with more than 95 percent of oak woodlands being stable for now. Mendocino County oak woodland is already five percent developed and another five percent is at risk of development before 2040.

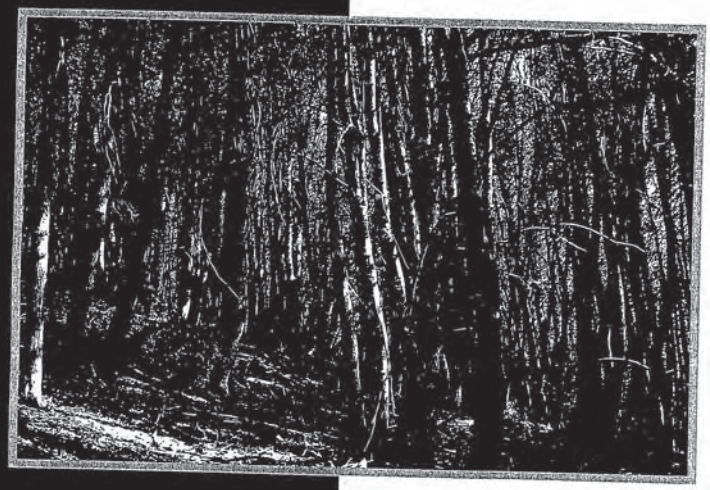
Letter B2 Attach B

North Interior Region

Lassen
Modoc
Shasta
Siskiyou
Trinity



Tanbark oak forest

North Interior Region

Counties in this region are Lassen, Modoc, Shasta, Siskiyou and Trinity.

OAK DISTRIBUTION

Nearly one million acres of oak woodland and 1.1 million acres of oak forest reside within the North Interior. The North Interior and the North Coast are the only two regions with more oak forest than oak woodland. With over 550,000 acres of oak woodland, Shasta County contains more than half of the region's totals. Trinity and Siskiyou Counties also contain large areas of oaks, with nearly 800,000 acres of oak forest and more than 400,000 acres of oak woodland in total. The North Interior has nearly 400 million oak trees, and 150 million of these oaks are greater than 5" DBH.

NORTH INTERIOR REGION OAK DIVERSITY

In this region, a balanced mixture of blue oak, black oak, canyon live oak and Oregon white oak woodlands is found. Blue oak woodlands typically include gray pine and either interior or coast live oak, and oaks comprise more than 80 percent of the basal area and more than 90 percent of the trees. Oregon white oak woodlands include black oak, Douglas-fir, and ponderosa pine, and oaks make up 40 percent of the basal area and more than half of the trees greater than 5" DBH. In black oak and canyon live oak woodlands, oaks comprise 50 percent of the basal area and 70 percent of the trees greater than 5" DBH.

In the North Interior oak forests, canyon live oak and black oak are prominent. These two oak species mix in with the local conifer species, including Douglas-fir, ponderosa pine, sugar pine and madrone. In black oak forests, oaks comprise one-fifth of the basal area. One-third of the trees greater than 5" DBH are oaks. In canyon live oak forests, one-third of the tree basal area is oaks and less than half of the trees greater than 5" DBH are oaks.

OAKS AT RISK IN THE NORTH INTERIOR REGION

In terms of ownership, 60 percent of North Interior oak woodlands are privately owned. The USFS manages 33 percent and the Bureau of Land Management (BLM) manages six percent. Excluding Shasta County, oak woodland ownership is split roughly 50-50 between private and public; the USFS manages most of the public oak woodland. Shasta County's oak woodland ownership is 73 percent private, 20 percent USFS, and six percent BLM.

Ten percent of the region's oak woodland has already been developed. Three percent is at risk for development by 2040. Eighty-seven percent is unlikely to develop before 2040. Shasta County oak woodland is most at risk with fifteen percent having been developed and five percent more to be developed by 2040. Oak woodlands in Trinity, Siskiyou, Modoc and Lassen Counties are all less than five percent developed and less than one percent at risk.

Central Coast Region

Alameda
Contra Costa
Marin
Monterey
San Benito
San Francisco
San Luis Obispo
San Mateo
Santa Barbara
Santa Clara
Santa Cruz
Solano
Ventura

Coast live oak savannah in Marin County

Central Coast Region

Counties included in this region are Alameda, Contra Costa, Marin, Monterey, San Benito, San Francisco, San Luis Obispo, San Mateo, Santa Barbara, Santa Clara, Santa Cruz, Solano and Ventura.

OAK DISTRIBUTION

The Central Coast is home to 1.6 million acres of oak woodlands and 300,000 acres of oak forests. Oaks are present on 17.5 percent of the region's area.

Four counties provide 75 percent of the Central Coast oak woodlands: Monterey, Santa Barbara, Santa Clara and San Luis Obispo. Oak woodlands comprise more than 20 percent of the area in Alameda, Monterey and Santa Clara counties. Santa Cruz County has more than 100,000 acres of forest oaks, and there are oaks present on over 50 percent of county land.

CENTRAL COAST OAK DIVERSITY

One-half of the Central Coast's oak woodland is coast live oak, and one-third is blue oak. Eighty percent of California's coast live oak woodland is in the Central Coast. Coast live oak woodland regularly includes bay trees, but oaks account for nearly 80 percent of the basal area in this oak type and over 90 percent of the trees greater than 10" in diameter. Blue oak woodland often includes coast live oaks.

Overall, more than 95 percent of trees in all size classes are oaks. Mixed oak woodlands include coast live oak and bay mixing with black and/or blue oaks. Oaks account for more than 60 percent of the basal area and more than 50 percent of the trees greater than 5" DBH in these stands. Thirty percent of the state's valley oak woodland is in the Central Coast, but there is not adequate inventory data to confidently describe this critical oak type.

Tanbark oak and coast live oak account for three-quarters of the region's oak forests. Redwood and Douglas-fir are dominant in tanbark oak forests, but oaks comprise 40 percent of the trees greater than 5" DBH and one-quarter of the basal area. Coast live oak forests often include canyon and/or interior live oak, with bay and redwood or Douglas-fir. Overall, oaks account for 10 percent of the basal area of oak forest stands and provide more than 20 percent of the trees greater than 5" DBH.

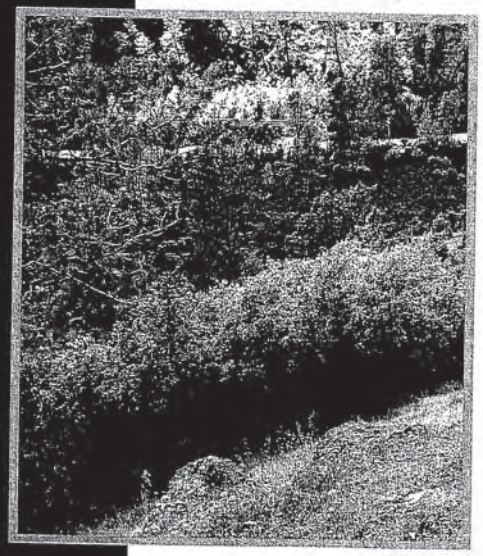
OAKS AT RISK IN THE CENTRAL COAST REGION

A complex land ownership matrix covers the oak woodlands of the Central Coast. Private ownership of oak woodlands predominates, averaging 75 percent throughout the region and ranging from 65 percent in Santa Barbara County to 95 percent in Alameda County. Another 15 percent is managed by the Los Padres National Forest, five percent by the US Military, and five percent by state and local governments. The Los Padres National Forest covers much of the oak woodlands in Ventura, Santa Barbara, San Luis Obispo and Monterey counties. Additionally, the BLM manages 20 percent of San Benito's oak woodlands and Fort Hunter-Liggett holds 12 percent of Monterey's oak woodlands. The state owns approximately 10 percent of oak woodland in Santa Clara, Contra Costa and Santa Cruz counties. Local ownership covers nearly 20 percent of oak woodland in Marin and Contra Costa counties.

Almost 85 percent of the Central Coast oak woodlands are unlikely to be developed before 2040. Most of the remaining areas have already been developed. Less than three percent is still at risk of development. Monterey County once again leads the way with 24,000 acres of oak woodland at risk, more than half of the region's total. Santa Clara, Santa Barbara, and San Luis Obispo counties are next on the list. Four percent of Monterey's oak woodlands are at risk, topped in the region only by Santa Cruz County at eight percent. In fact, more than three-quarters of Santa Cruz's oak woodlands have already been developed and less than 16 percent are currently in the stable category. Both of these figures are records for the state.

Sacramento Region

Butte
Colusa
El Dorado
Glenn
Lake
Napa
Nevada
Placer
Plumas
Sacramento
Sierra
Solano
Sutter
Tehama
Yolo
Yuba



Mixed oak woodland dominated by gray pine

Sacramento Region

Counties in this region include Butte, Colusa, El Dorado, Glenn, Lake, Napa, Nevada, Placer, Plumas, Sacramento, Sierra, Solano, Sutter, Tehama, Yolo and Yuba.

OAK DISTRIBUTION

The Sacramento region's 2.1 million acres of oak woodlands provide nearly one-quarter of the state's total. Oaks are present on 20 percent of the region's land.

Tehama County has more oak woodlands than any other county in the region, but large oak populations are found in many counties. Thirty-three percent of Napa County is covered by oak woodlands, giving it the greatest density of oak woodlands in the state. Tehama, Yuba, Lake and Nevada counties are each at least 20 percent covered by oak woodlands.

SACRAMENTO REGION OAK DIVERSITY

More than half of the Sacramento region's oak woodlands are blue oak. Gray pines mix in, but oaks comprise 70 percent of the basal area and 80 percent of the trees greater than 5" DBH. The region contains more than one-third of the state's blue oak woodland.

Interior live oak woodland contains blue oak, valley oak, black oak, gray pine, and ponderosa pine. Canyon live oak and black oak woodlands include Douglas-fir, ponderosa pine, and incense cedar. In canyon and interior live oak woodland, oaks make up 80 percent of the basal area and 90 percent of the trees.

The Sacramento region has more than one-third of California's valley oak woodland. Tehama County has the most blue oak, valley oak and canyon live oak woodland. El Dorado has the most interior live oak and black oak woodland.

Black oak and canyon live oak dominate the region's oak forests. Canyon live oak forests are 60 percent oaks, mixing with ponderosa pines and Douglas-firs. Black oak forests are 25 percent oaks, along with Douglas-fir, ponderosa pine, white fir and incense cedar.

OAKS AT RISK IN THE SACRAMENTO REGION

More than 80 percent of the Sacramento region's oak woodland is privately owned. The USFS owns about 60 percent of the remaining public lands, including large portions of the oak woodlands in Plumas (81 percent), Sierra (74 percent), Glenn (28 percent), Placer (20 percent) and Lake (19 percent) counties.

Private ownership of oak woodlands surpasses 80 percent in all other counties, topped off by Solano (98 percent), Yolo (97 percent), Sacramento (96 percent), Colusa (94 percent), and Napa (93 percent) counties.

The Sacramento region is more at risk of development than any other. Only two-thirds of its oak woodlands are considered 'stable.' One-sixth is developed and one-sixth is at risk. More than 300,000 acres of oak woodland could be developed in the Sacramento region by 2040.

El Dorado County has more oak woodlands at risk than any other county in the state, but Tehama, Butte and Yuba counties are not far behind. By 2040, 80 percent of El Dorado's oak woodlands and more than half of the oak woodlands in Nevada, Yuba and Placer counties may be developed.

San Joaquin Region

Alpine
Amador
Calaveras
Fresno
Inyo
Kern
Kings
Madera
Mariposa
Merced
Mono
San Joaquin
Stanislaus
Tulare
Tuolumne

Valley oaks in Calaveras County

San Joaquin Region

Counties in this region are Alpine, Amador, Calaveras, Fresno, Inyo, Kern, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne.

OAK DISTRIBUTION

The San Joaquin region has more than 2.3 million acres of oak woodlands and 500,000 acres of oak forests. Oaks are present on only 10 percent of the region's land. However, certain portions of the region have far greater oak woodland density than others. Twenty-seven percent of the state's oak woodlands fall within these 15 counties. The San Joaquin region currently has more than 450 million oak trees. More than one-third of these oaks are larger than 5" DBH.

SAN JOAQUIN REGION OAK DIVERSITY

More than half of the region's oak woodlands are blue oak and another 25 percent are interior live oak. Associated species include gray pine and buckeye, as well as valley oak, blue oak and canyon and interior live oaks. The San Joaquin region has more blue oak woodlands and interior live oak woodlands than any other region. In blue oak woodlands, oaks account for 70 percent of the trees and 80 percent of the basal area and trees greater than 5" DBH. In interior live oak woodlands, oaks provide 70 percent of the tree basal area and more than 80 percent of all trees. In canyon live oak woodlands, oaks comprise 55 percent of the basal area, 62 percent of all trees and 67 percent of trees greater than 5" DBH.

Canyon live oak and black oak comprise almost 90 percent of oak forests. Associated species in San Joaquin oak forests include incense cedar, ponderosa pine, sugar pine and white fir. In canyon live oak forests, oaks provide one-third of the basal area and nearly one-half of the trees. In black oak forest, oaks comprise more than half of the trees, but only one-third of the trees greater than 5" DBH and only one-quarter of the tree basal area.

OAKS AT RISK IN THE SAN JOAQUIN REGION

Seventy-three percent of the San Joaquin region's oak woodlands are privately owned. The USFS owns 18 percent and BLM owns five percent. Ten percent of the oak woodlands in the region have already been developed. Ten percent are at high risk of development by 2040. Eighty percent are currently stable, however targeted planning could ensure that a greater number of acres are conserved for the long-term. Nearly 250,000 acres of oak woodlands in the San Joaquin region are at risk of development by 2040. Only the Sacramento region contains more oak woodlands at risk. In Madera, Amador and Calaveras counties combined, more than one-third of all oak woodland may be developed before 2040.

Southern Region

Imperial
Los Angeles
Orange
Riverside
San Bernardino
San Diego

Blue oak woodland in Machesna Mountain Wilderness, Los Padres National Forest

Southern Region

Counties in this region are Imperial, Los Angeles, Orange, Riverside, San Bernardino and San Diego.

OAK DISTRIBUTION

The Southern region is home to more than 300,000 acres of oak woodlands and more than 200,000 acres of oak forests. Combined, these 500,000 acres comprise only two percent of the region. However, discounting urban areas and desert, oak woodland concentration is much higher. San Diego and Los Angeles counties collectively contain more than two-thirds of the Southern region's oak woodlands. San Bernardino County has the greatest area (90,000 acres) of oak forests in the region.

SOUTHERN REGION OAK DIVERSITY

Coast live oak and canyon live oak are most prevalent, but black oak and Engelmann oak populations are also significant. Eighty-five percent of the basal area is comprised of oaks. Ninety-two percent of the trees greater than 5" DBH are oaks and 96 percent of the trees greater than 1" DBH are oaks. The rare Engelmann oak is found only within this region, mostly in San Diego County. Los Angeles County is home to the majority of the region's blue oak and valley oak woodlands.

Canyon live oak and black oak dominate in the Southern region's oak forests. These oaks mix with Coulter pine, Jeffrey pine, incense cedar and white fir.

Oaks comprise less than 50 percent of the basal area but more than 80 percent of the trees and 65 percent of the trees greater than 5" DBH.

OAKS AT RISK IN THE SOUTHERN REGION

The oak woodlands of the Southern region have the highest levels of public ownership found in the state. USFS owns 44 percent of the region's oak woodlands. Eleven percent of oak woodlands are owned by other government agencies, and 45 percent are privately owned. The land ownership patterns within this region are variable. The oak woodlands in San Diego and Orange counties are predominantly privately-owned, but the USFS owns most of the oak woodlands in San Bernardino, Riverside and Los Angeles counties.

Twenty percent of the Southern region's oak woodlands have already been developed. Ten percent are at risk of development by 2040. Development of the remaining 70 percent is not anticipated in the near future. Oak woodland development percentages are higher than in any other region in the state. Only the Sacramento region has a lower percentage of oak woodlands that are considered stable.

Riverside and San Diego counties lead the region with almost 20 percent of their oak woodlands at risk. Both Orange and Los Angeles counties have already had over 20 percent of their oak woodlands developed.

San Diego and Orange counties have the lowest percentages of stable oak woodland with 65 percent in each county. San Bernardino tops the list with 78 percent stable for the time being.

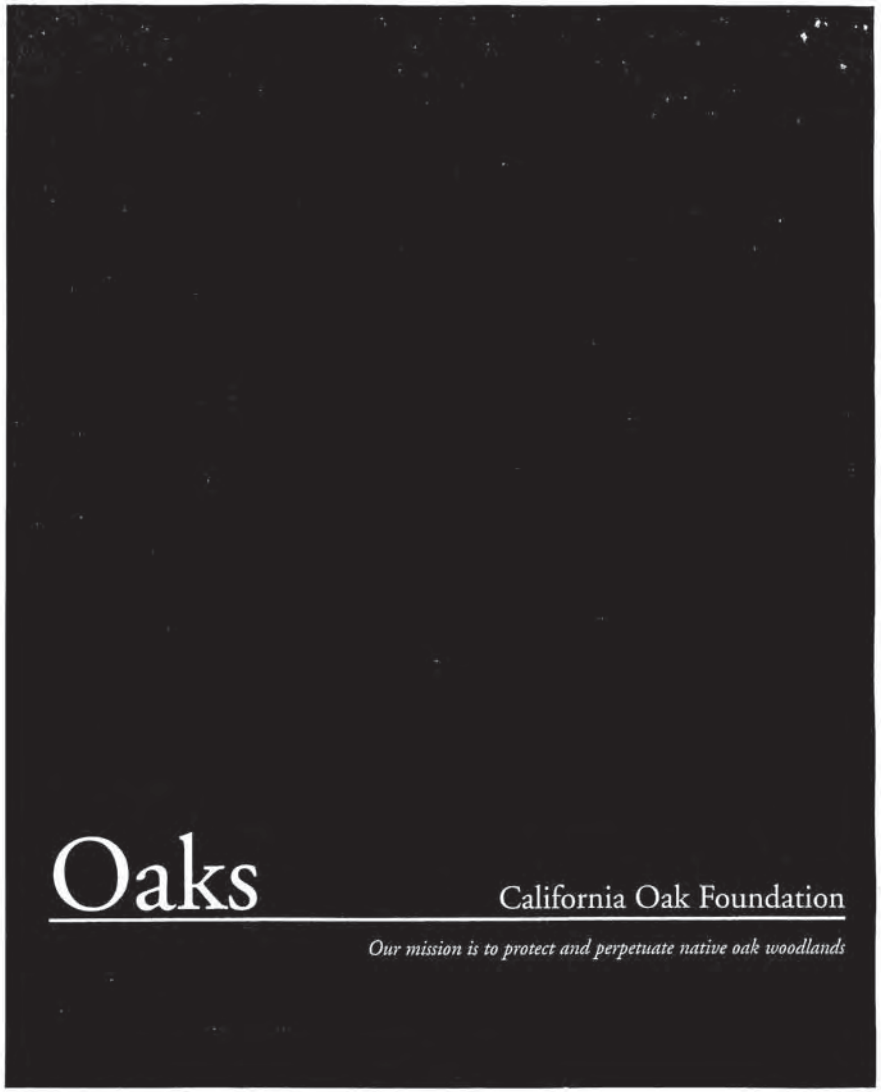
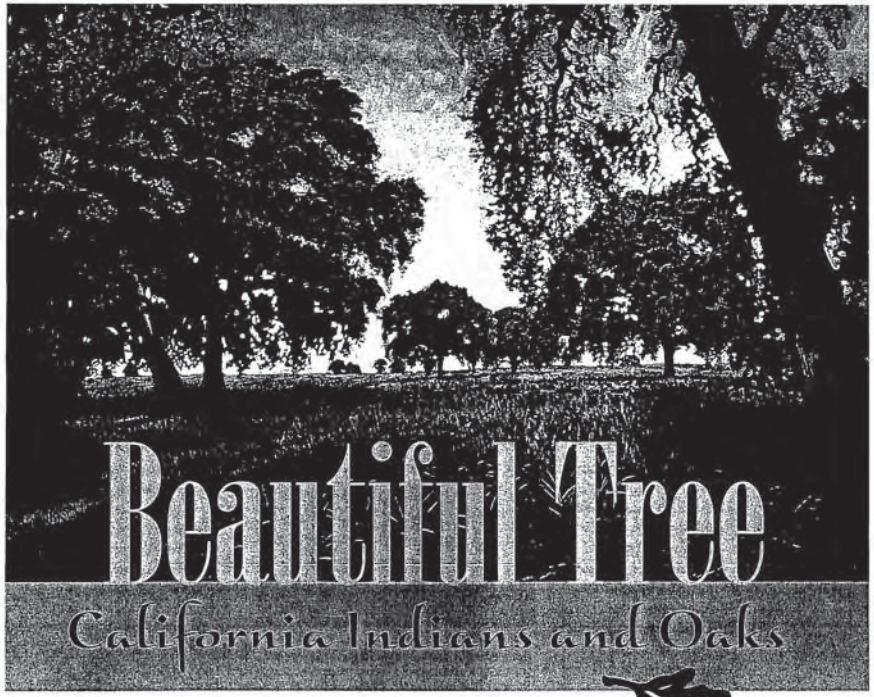
Our mission is to protect and perpetuate native oak woodlands.





Beautiful Tree

California Indians and Oaks

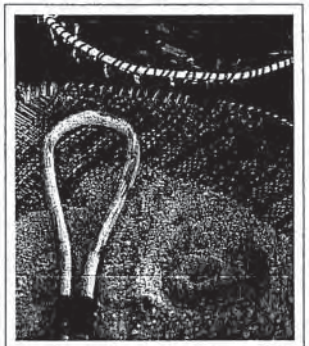
SARA-LARUS TOLLEY

When Europeans first stepped foot in the territory now called California, it was one of the most densely populated areas on the continent. The rich ecosystem was made up of a web of interrelated plants and animals, many of which relied on oaks or acorns to survive. Remnants of the great oak savannahs remain in some parts of the state, but urbanization, agriculture, and grazing have taken their toll. Yet, Native peoples of California still consider the acorn a symbol of the sustenance of their cultures, and today environmentalists frequently turn to the tribes to help build coalitions for the preservation of open space where oaks might spread their branches. One important connection that the tribes emphasize in such struggles is that protecting oaks means protecting sacred areas: village sites, pounding rocks, burial places. Here, respecting Native peoples and respecting oaks go hand in hand. This special supplement celebrates Indian peoples' relationships with oaks, oak-based ecological communities, and acorns. It highlights connection and looks to protection, in the spirit of something Makahmo Pomo basketweaver Elsie Allen once said: "The Indians and the acorn trees are just like the same thing. We wouldn't be the same Indians if there weren't acorns. Far as I know, the acorn trees have always been here and so have we."

In the Pomo language, the word for oak, chiskale, means "beautiful tree."

Kaweah Oaks, oil on canvas, 2004, by Laura Cunningham.

There are twenty species of oak in California and, ecologically speaking, sixty-eight oak communities. Oaks are absent from only the most extreme environments. This means great diversity on a common plan: valley oaks can grow up to 150 feet tall, while the huckleberry oak grows only three or four feet. Botanically, oaks (genus *Quercus*) are divided into three broad groups, apparently distinguished by bark coloring, but in fact distinguished by acorn production: there are white, black, and intermediate oaks. White oaks produce an acorn crop in one year; black oaks take two years. And while the meat of white oak acorns is white, sweet, and palatable, black oak acorns have higher fat content and are yellow in appearance and often bitter with tannins. "Intermediate" oaks are just that—intermediate between white and black. The black oaks are generally the favored species when it comes to harvesting acorns for food. Tan oaks are also favored, and perhaps even preferred. Botanically tan oaks belong to a separate genus and species *(Lithocarpus)* and are thus technically not oaks, but we include them in this supplement on the merit of their tasty acorns and the cultures they have sustained.



Acorn flour ground by Rose Enos (Washoe/Maidu) in a sifting basket by her mother, Lizzie Enos (Washoe/Maidu), at a demonstration at the Oakland Museum. Photo by Dugan Aguilar.

As with all things in nature, oaks have cycles of productivity. Some years are better for acorn than others and thus the diversity of oak species in a landscape is very important. In terms of human use, these cycles of good and bad years mean that the gathering and storage of acorns is a true skill. Along similar lines, tribal leaching technologies were real breakthroughs that made available a nutritional bounty from an otherwise unpalatable and indigestible plant form. As Pavlik et. al. explain, "Depending on the species, acorns can contain up to 18 percent fat, 6 percent protein, and 68 percent carbohydrate (the rest being water, minerals, and fiber). In comparison, modern varieties of corn and wheat have 2 percent fat, 10 percent protein, and 75 percent carbohydrates. Acorns are also good sources of vitamins A and C and many of the essential amino acids" (2002: 76). The contributors to this supplement celebrate the taste and styles of eating such an excellent food source.

California peoples' technological innovations and cultural patterns of using acorn led, in turn, to techniques for leaching buckeye, grinding pinole, and processing other plants. Again and again we'll find that oaks played their part in the bounty of the California landscape in more than the most obvious ways.

For instance, it is worth contemplating the mycorrhizal relationship between oak roots and fungi. Oaks gather water through fuzzy white root coverings called mycorrhizae and the sugars in these root coverings attract fungi that give the oak roots water and minerals. What this leads to

Native Californians and foresters often differ on their views of the tan oak. For Native Californians, the tan oak is a beautiful tree, a source of nourishment and delight; for foresters, it's a tree that usurps land from other trees, grows very quickly, and is generally seen as a scourge. Because of this difference, Native communities and foresters often disagree about which trees to protect and conserve.

Letter B2 Attach C

is the production of the delectable *Boletus edulis* (porcini), honey, and other mushrooms!

Further still, the large amount of protein and fat in acorns is more than enough to nourish a wide variety of animals. Mule deer browse extensively on acorns as well as on oak leaves and twigs. And it's not just deer: of California's 169 terrestrial mammals, at least 60 use oak communities and landscapes. Oaks support little mammals—harvest mice, dusky-footed woodrats—and big ones—mountain lions, black bears, even grizzlies back in the day. (Joaquin Miller and many others described young grizzlies dining delicately in tired oak branches, or adults pounding their weight against trees to get the fatty seeds to fall.)

Mary Birchfield (Yurok) blowing ash off a cooking stone that has been lifted from the fire with a cooking paddle. Sumeg Village dedication, Patrick's Point State Park, September 22, 1990. Photo by Beverly R. Ortiz.

Countless varieties of insects are attracted to these trees, too. Oaks host more gall insects than any other native tree in the United States. A gall develops as part of a chemical reaction that occurs when insect eggs (typically wasp eggs) hatch into larvae. These tumor-like growths will be used as food for the larvae so they can make it to their adult stage. Meanwhile, millions of migrating birds are dependent on these same insects that inhabit the oak corridors. (The term "corridor," by the way, might help you visualize the state's remaining oak communities as pathways for animals that, sadly, do not always connect without breaks.) In oak communities, one finds so many amazing creatures: Rare ants. Arboreal salamanders. Western skinks, with their glamorous blue tails, as you'll see represented in one of Bari Talley's illustrations in this supplement. Even common creatures become alluring when their biological story gets told: oaks support communities of acorn woodpeckers, who are cooperative breeders, sharing their granaries as they raise their young in extended families. So dependent are they on their oak environment, the cooperative system breaks down when there are shortages due to the destruction of the many varieties of oak they rely upon. Oaks, you see, are the keystone species in their environments. If they go, the whole interrelated web goes. The point here and throughout this supplement is that when we think of oaks, we should expand our sense of the bounty that they provide.

Again looking to humans and their relationships with these trees, besides the acorns and the animals attracted to the acorns, oaks provide wood for cooking and heating and material for decorative and everyday arts. Oaks also form the basis for creation myths and tribal identities: eating acorn has become a means of internalizing culture and constituting oneself (on a cellular level!) as a California Indian person. And teaching about oaks and acorn is a means of cultural education. Here, culture and conservation come together once again, because a traditional component of the California Indian world view is, in the most general sense, that the bounty of oaks needs to be used to be fully respected. Helen McCarthy has written sensitively about this topic.

> There is a strong interdependence between plants and people. The acorns—and other resources as well—were put here on earth for people to use, for people's survival. The people need the plants in order to live, but the plants also need the people; they need people to gather their seeds, and leaves, and roots, and to talk and sing and pray to them....If plants are not used by people the spiritual relationship is broken, and the plants no longer have a place (1993: 225).
