

Affected Environment and Environmental Consequences

This chapter presents the affected environment and the environmental consequences and mitigation measures of the proposed BMKV expansion. The analysis of environmental consequences is based on the conceptual designs for wetland restoration presented in the previous chapter. Each of the restoration alternatives and the No-Action Alternative are analyzed in terms of the following resource topics.

- Geology, Soils, and Seismicity
- Surface-Water Hydrology and Tidal Hydraulics
- Water Quality
- Public Health
- Biological Resources
- Land Use and Public Utilities
- Hazardous Substances and Waste
- Transportation
- Air Quality
- Noise
- Cultural Resources
- Aesthetics

The focus of the analysis of environmental consequences is limited to the determination of whether the restoration alternatives would result in a “significant effect on the environment,” according to CEQA, or would “significantly affect the quality of the human environment,” according to NEPA.

CEQA defines a *significant effect on the environment* as “a substantial, or potentially substantial, adverse change in the environment” (PRC Div. 13 21068). CEQA Guideline 15382 describes *adverse change* as an “adverse change in any of the physical conditions within the area affected by the project

1 including land, air, water, minerals, flora, fauna, ambient noise, and objects of
2 historic or aesthetic significance.”

3 CEQ NEPA Guideline 1508.14 defines the *human environment* as “the natural
4 and physical environment and the relationship of people with that environment.”
5 *Significantly*, as used in NEPA, requires considerations of both context and
6 intensity (CEQ NEPA Guideline 1508.27).

7 Specific significance threshold criteria that were used to evaluate the significance
8 of potential effects of the proposed restoration alternatives are presented below in
9 the discussion of each subject area.

10 Furthermore, the evaluation of the potential effects of the wetland restoration
11 alternatives uses the existing conditions on the expansion site as the baseline
12 condition on which potential impacts are measured against.

13 **Geology, Soils, and Seismicity**

14 **Affected Environment**

15 **Data Sources**

16 This section is based on previous geotechnical investigations and environmental
17 studies performed within the BMKV site and neighboring areas. The primary
18 sources of information used to prepare this section include the following
19 documents.

- 20 ■ *Geotechnical Investigation Bel Marin Keys Unit 5* (Miller Pacific
21 Engineering Group 1995)
- 22 ■ *Bel Marin Keys Unit V Final Environmental Impact Report/Environmental*
23 *Impact Statement* (Environmental Science Associates 1993)

24 **Regional Geology and Topography**

25 The expansion site is located within California’s geologically and seismically
26 active Coast Ranges Geomorphic Province. The province is characterized by a
27 series of northwest-trending faults, mountain ranges, and valleys (figure 4-1)
28 (Environmental Science Associates 1993).

29 The expansion site consists of former mudflats and marshlands that constitute a
30 portion of the nearly level Bay Plain geomorphic zone, which extends from the
31 edge of San Pablo Bay to the foot of the hills located immediately west of the
32 site. The construction of agricultural levees in 1892, and subsequent agricultural

1 land drainage activities, caused the expansion site to settle to its current elevation
2 of -4 to -5 feet National Geodetic Vertical Datum (NGVD) (Miller Pacific
3 Engineering Group 1995).

4 The expansion site is underlain entirely by bay mud, which consists of soft,
5 unconsolidated silty clays that typically exhibit low permeability, high
6 compressibility, and low shear strength. The thickness of the bay mud deposits
7 located beneath the project site ranges from 90 feet near San Pablo Bay to 20 feet
8 near Pacheco Pond. Bay mud deposits in the expansion area are typically
9 underlain by much stronger and less compressible soils and geologic deposits.
10 The groundwater table beneath the expansion site typically resides from 2 to 4
11 feet below the ground surface but often nears the surface during the rainy season
12 (Miller Pacific Engineering Group 1995).

13 **Soils**

14 According to the Soil Survey of Marin County (Kashiwagi 1985), the bay mud
15 deposits that underlie the expansion site are overlain entirely by soils of the
16 Reyes series. Soils of the Reyes series typically consist of slowly permeable
17 clays and silty clays. The near-surface horizon of the Reyes soil at the expansion
18 site is referred to as a “desiccated crust” by Miller Pacific Engineering Group
19 (1995), apparently because their textural properties do not contrast significantly
20 with those of the underlying bay mud deposits. The Reyes soils are more
21 consolidated than underlying bay mud deposits but are still susceptible to
22 settlement when dewatered or subjected to large static-fill loads (Miller Pacific
23 Engineering Group 1995). Due to the fine texture of the Reyes soil and the low
24 slope gradients that prevail at the expansion site, the hazard of soil erosion is
25 slight.

26 **Seismicity and Geologic Hazards**

27 The expansion site is located in one of the most seismically active regions in the
28 United States. The site’s seismic setting is dominated by the Hayward fault to
29 the southeast, the San Andreas fault to the west, and the Healdsburg–Rogers
30 Creek fault to the northeast (figure 4-1). The maximum credible earthquake for
31 each of these faults, measured in Richter scale magnitude (M), is as follows.

- 32 ■ Hayward fault—7.5 M
- 33 ■ San Andreas fault—8.3 M
- 34 ■ Healdsburg–Rogers Creek fault—7.2 M

35 Two smaller, potentially active faults are near the expansion site. A possible
36 trace of the Burdell Mountain fault is mapped as extending toward and
37 terminating north and west of the expansion site. Estimates differ regarding the
38 date of the last displacement on the Burdell Mountain fault. It is generally

1 thought to have been active during the Quaternary period (the last 2.5 million
2 years), and some evidence suggests that it may have been active during the
3 Holocene epoch (the last 11,000 years) (Environmental Science Associates
4 1993). The Tolay fault also reaches to within 6.5 miles of the expansion site and
5 may be active (Robert Bein, William Frost & Associates 1995).

6 The expansion site is likely to undergo ground shaking from a major earthquake.
7 The U.S. Geological Survey (USGS) has estimated that there is a 67%
8 probability that there will be 1 or more earthquakes of magnitude 7.0 or greater
9 in the Bay Area in the next 30 years (Environmental Science Associates 1993).

10 Four major hazards are associated with earthquakes: surface fault rupture,
11 ground shaking, ground failure, and inundation resulting from earthquake-
12 generated waves (tsunamis or seiches).

13 **Ground Shaking**

14 Factors that would affect the intensity of ground shaking at the expansion site
15 during an earthquake on a nearby fault include the following.

- 16 ■ Characteristics of the fault generating the earthquake
- 17 ■ Distance to the fault and earthquake hypocenter
- 18 ■ Earthquake magnitude
- 19 ■ Earthquake duration
- 20 ■ Site-specific geologic conditions (i.e., the nature of the geologic materials
21 underlying the expansion site) (Miller Pacific Engineering Group 1995)

22 Unconsolidated materials tend to amplify ground shaking to a greater extent than
23 bedrock. Accordingly, ground shaking during an earthquake would likely be
24 more intense at the expansion site than in nearby areas underlain by bedrock.

25 **Surface Fault Rupture**

26 No active or potentially active faults are known to exist within the boundaries of
27 the expansion site. In addition, the expansion site is not within an Alquist–Priolo
28 Special Studies Zone, as designated by the California Division of Mines and
29 Geology (Hart and Bryant 1997). Accordingly, the potential for surface fault
30 rupture to occur at the expansion site is remote (Miller Pacific Engineering
31 Group 1995).

1 **Ground Failure**

2 Ground-failure hazards of potential concern at the site include liquefaction,
3 earthquake-induced settlement, and lurching. All of these processes involve the
4 displacement of the ground surface resulting from a loss of strength or failure of
5 the underlying materials because of ground shaking.

6 Liquefaction is the sudden loss of soil strength during strong ground shaking,
7 which results in temporary fluid-like behavior of the affected soil materials.
8 Liquefaction typically occurs in areas where groundwater is shallow and
9 materials consist of clean, poorly consolidated, fine sands and silts. The Reyes
10 soils and bay mud deposits that underlie the expansion site are not conducive to
11 liquefaction because they do not contain substantial quantities of clean sands and
12 silts (Miller Pacific Engineering Group 1995).

13 Ground shaking can also induce the settlement of loose, granular soils (i.e., clean
14 sands and silts) located above the groundwater table. The Reyes soils and bay-
15 mud deposits that underlie the expansion site consist of clays and silty clays
16 rather than clean sands and silts. Thus, there is no potential for seismic
17 settlement to occur at the expansion site (Miller Pacific Engineering
18 Group 1995).

19 Lurching, or lurch cracking, is the cracking of the ground surface in soft,
20 saturated material as a result of earthquake-induced ground shaking. Lurch
21 cracking generally occurs along the edge of steep embankments where stiff soils
22 (e.g., manufactured fill materials) are underlain by soft, compressible soils and
23 geologic deposits (Miller Pacific Engineering Group 1995). Because the
24 expansion site is underlain by soft, compressible bay-mud deposits, there is a
25 potential for earthquake-induced lurch cracking to occur at the expansion site
26 during an earthquake (Miller Pacific Engineering Group 1995).

27 **Earthquake-Induced Inundation (Tsunamis and Seiches)**

28 Tsunamis are sea waves produced by large-scale seismic events on the ocean
29 floor. Seiches are earthquake-generated waves that form in enclosed water
30 bodies, such as lakes or tidal marshes. Both can cause temporary inundation of
31 upland areas. Due to its proximity to San Pablo Bay, there is a potential for the
32 expansion site to be affected by tsunamis and seiches.

33 A tsunami with a 100-year recurrence interval (i.e., a 1% probability of
34 occurrence in a given year) has an estimated run-up of 3 feet in the vicinity of the
35 expansion site (Miller Pacific Engineering Group 1995). Likewise, a seiche
36 generated in the vicinity of the expansion site is expected to be relatively small
37 (less than a few feet) (Miller Pacific Engineering Group 1995). At its current
38 elevation, the expansion site could be flooded by a tsunami in the event that the
39 existing outboard levee fails or is overtopped (Environmental Science
40 Associates 1993).

Environmental Consequences and Mitigation Measures

Approach and Methods

The following evaluation of potential geologic, seismic, and soil-related impacts associated with potential restoration was based on a review of geotechnical reports prepared for restoration and development in and immediately adjacent to the expansion site, the professional opinions rendered in these reports, and professional judgement.

Impact Mechanisms

The following restoration-related activities and natural processes could result in accelerated soil erosion; loss of nonrenewable soil or geological resources; personal injury; loss of life; or substantial damage to property, structures, or related improvements.

- Mass land grading and other forms of soil and vegetation disturbance
- Placement of fill materials on weak, compressible bay-mud deposits
- Earthquake-induced ground shaking

Thresholds of Significance

The following significance criteria were used to evaluate the proposed BMKV expansion. Regarding geology, soils, and seismicity, the proposed expansion was considered to result in a significant impact if it would

- result in a substantial change in topography or the destruction of any unique geologic formation or soil type;
- result in substantial soil erosion or the loss of nonrenewable soil resources;
- substantially degrade physical, chemical, or biological soil quality, and thereby degrade the ability of onsite soils to support sensitive habitats, such as wetlands;
- cause personal injury, loss of life, or substantial damage to property, structures, or site improvements as a result of *existing* geologic, seismic, or soil-related hazards; or
- cause personal injury, loss of life, or substantial damage to property, structures, or site improvements as the result of geologic, seismic, or soil-related hazards that would be *created* during the construction and operation of the restoration site.

1 **Impacts and Mitigation Measures of No-Action** 2 **Alternative**

3 **Impact G-1: Continued Land-Surface Settlement,** 4 **Substantial Alteration of Natural Topography, and Loss of** 5 **Soil Resources Capable of Supporting Sensitive Wetland** 6 **Habitats**

7 Under the No-Action Alternative, the expansion site would continue to be used
8 for limited agricultural production. If the expansion site continued to be used for
9 agricultural production, ground-surface settlement would likely continue to occur
10 at its existing rate.

11 **Impacts and Mitigation Measures Common to** 12 **Alternatives 1–3**

13 **Impact G-2: Settlement of Proposed Levees, Uplands,** 14 **Seasonal Wetlands, and Tidal Wetlands in Response to** 15 **the Placement of Static Fill Loads**

16 Implementation of Alternatives 1–3 would involve the construction of levees in
17 the northwestern portion of the expansion site. Alternative 1 and Revised
18 Alternative 2 would also involve the placement of dredged materials to create
19 upland, seasonal wetland, and tidal wetland habitats. The Reyes clay soils and
20 the bay-mud deposits that underlie the expansion site are compressible and
21 therefore susceptible to settlement. The static loads imposed on these materials
22 from the construction of levees and the placement of dredged materials would
23 result in some degree of ground-surface settlement. The resulting settlement
24 could be *uniform*, which would involve relatively uniform settlement over the
25 affected area, or *differential*, which would involve unequal settlement over the
26 affected area. Both types of settlement could affect the structural integrity of
27 and/or reduce the level of flood protection provided by the levees. Additionally,
28 ground-surface settlement resulting from the placement of dredged materials
29 could temporarily inhibit the development of some of the proposed upland,
30 seasonal wetland, and tidal wetland habitats.

31 The type (i.e., uniform or differential), ultimate amount, and rate of settlement
32 that would occur would depend on the amount of fill placed, thickness of the
33 underlying bay mud, and elevation of groundwater beneath the expansion site
34 (Miller Pacific Engineering Group 1995). Uniform settlement is most likely to
35 occur in areas where the thickness of both fill and underlying bay-mud deposits
36 is relatively uniform (e.g., in the vicinity of the proposed tidal sub-basins).
37 Conversely, differential settlement is most likely to occur in areas where there
38 are significant differences in the thickness of fill and abrupt changes in the
39 thickness of the underlying bay-mud deposits (e.g. near Pacheco Pond). The

1 ultimate amount of settlement would increase proportionately with thickness of
2 fill and underlying bay-mud deposits. The rate of settlement would increase with
3 the thickness of fill but decrease with the thickness of the underlying bay-mud
4 deposits. Most settlement is expected to occur within the first 30–50 years after
5 fill placement; settlement would slow appreciably after that time (Miller Pacific
6 Engineering Group 1995; Jones & Stokes Associates 1996).

7 Detailed geotechnical investigations and analyses would be conducted during the
8 final design stage of the proposed BMKV expansion to address the levee
9 construction and dredged-material placement components of the selected
10 restoration alternative with respect to settlement. These design-level
11 investigations would identify and evaluate subsurface conditions encountered at
12 the expansion site (e.g., thickness and compressibility of the bay-mud deposits)
13 and describe how settlement would be mitigated and compensated for through
14 the implementation of standard engineering methods. The specific techniques
15 used to minimize and compensate for anticipated settlement would depend on the
16 findings of the design-level geotechnical investigations, but could include:

- 17 ■ placement of additional fill above the intended finish grade of levees to
18 compensate for anticipated settlement and sea-level rise;
- 19 ■ application of surcharge loads or other settlement acceleration techniques,
20 such as the installation of wick drains; and
- 21 ■ uniform placement of fill during construction and avoidance of excessive fill
22 placement.

23 Because the final design of the selected restoration alternative would be based on
24 detailed subsurface investigations and would incorporate appropriate measures to
25 adequately mitigate and/or compensate for anticipated settlement, this impact is
26 considered less than significant.

27 **Impact G-3: Potential Levee Slope Failure Resulting from** 28 **the Low Shear Strength of Underlying Bay-Mud Deposits**

29 Implementation of Alternatives 1–3 would involve the construction of levees in
30 the northwestern portion of the expansion site. The shear strength of the bay-
31 mud deposits on which these levees would be constructed varies with depth and
32 prior loading conditions, but it is typically relatively low (Environmental Science
33 Associates 1993; Miller Pacific Engineering Group 1995; Jones & Stokes
34 Associates 1996). Although the shear strength of the bay-mud deposits would
35 increase over time as they consolidate in response to the static fill loads imposed
36 by the levees, the initially low strength of the bay-mud deposits could destabilize
37 the levee embankments and possibly cause them to fail if the levees are not
38 constructed correctly. Levee failure or destabilization would decrease the level
39 of tidal flood protection provided by the proposed levees. Other factors that
40 would influence the stability of the proposed levee embankments include the type
41 and shear strength of the material used to construct the levees, height and

1 gradient of the levee embankments, and depth to which the proposed levees are
2 inundated.

3 Detailed geotechnical investigations and analyses would be conducted during the
4 final design of the selected restoration alternative to evaluate the engineering
5 properties of the materials that would be used to construct the proposed levees
6 and the bay-mud deposits on which the levees would be constructed. Based on
7 the findings of these design-level investigations, standard engineering techniques
8 would be incorporated into the final design and construction of the levees to
9 minimize the potential for levee failure or destabilization. The specific
10 techniques used to minimize the potential for levee failure and destabilization
11 would depend on the findings of the design-level geotechnical investigations but
12 could include:

- 13 ■ placement of levee fill in stages so that low strength bay-mud deposits are
14 not overstressed;
- 15 ■ uniform placement of fill during construction and avoidance of excessive fill
16 placement;
- 17 ■ application of surcharge loads or other settlement acceleration techniques,
18 such as installation of wick drains, to increase the shear strength of
19 underlying bay-mud deposits; and
- 20 ■ placement of stabilizing fill against the base of the proposed levees
21 (permanent toe berms).

22 Because the final design of the selected alternative would be based on detailed
23 subsurface investigations and would incorporate standard design and construction
24 techniques to adequately minimize the potential for levee failure and
25 destabilization, this impact is considered less than significant.

26 **Impact G-4: Potential Short-Term Increase in Erosion and** 27 **Sedimentation Rates during Construction**

28 Many of the activities that would be conducted during the construction of
29 Alternatives 1–3, such as the establishment and use of an equipment staging area,
30 lowering of the levee adjacent to Novato Creek, and improvement of the existing
31 levee located south of the BMK lagoon, would result in disturbances to soil and
32 existing vegetation. Although the erosion hazard throughout the expansion area
33 is slight under normal conditions, these and other construction-related
34 disturbances would expose bare soil to erosion by water and wind and could
35 increase erosion and sedimentation rates above pre-construction levels.
36 However, a Storm Water Pollution Prevention Plan (SWPPP) would be prepared
37 and implemented to address these and other construction-related erosion and
38 sedimentation issues and to comply with the requirements of the National
39 Pollutant Discharge Elimination System (NPDES) general construction activity
40 stormwater permit or other individual permit issued and administered by the

1 California State Water Resources Control Board. The SWPPP would prescribe
2 temporary measures to control accelerated erosion and sedimentation in disturbed
3 areas during construction, and permanent measures to control accelerated erosion
4 and sedimentation once construction is complete. Implementation of the SWPPP
5 would substantially reduce the potential for accelerated erosion and
6 sedimentation to occur as a result of construction. Therefore this impact is
7 considered less than significant.

8 Sedimentation issues associated with the placement of dredged material and
9 levee construction are addressed in the *Water Quality* section of this chapter.

10 **Impact G-5: Potential Damage to Proposed Levees** 11 **Resulting from Earthquake-Induced Ground Shaking and** 12 **Lurch Cracking**

13 The expansion site is likely to experience ground shaking from a major
14 earthquake in the next 70 years. Because the expansion site is underlain by
15 unconsolidated bay-mud deposits, ground shaking likely would be more intense
16 at the expansion site than in adjacent areas underlain by bedrock. Earthquake-
17 induced ground shaking and associated lurch cracking could damage the levees
18 proposed under Alternatives 1–3 and possibly increase the potential for tidal
19 flooding in adjacent residential communities.

20 Detailed geotechnical investigations and analyses would be conducted during the
21 final design of the selected restoration alternative to evaluate the engineering
22 properties of the materials that would be used to construct the proposed levees
23 and bay-mud deposits on which levees would be constructed. Based on the
24 findings of these design-level investigations, standard engineering techniques
25 would be incorporated into the final design and construction of the proposed
26 levees to minimize the potential for lurch cracking and levee displacement during
27 episodes of strong ground shaking. In addition, the conceptual restoration design
28 already includes features that would minimize the potential for flooding in the
29 event that the proposed flood control levees were damaged during an earthquake.
30 These include (i) the installation of an outlet (culvert with flap gate) to Novato
31 Creek and (ii) the improvement of the existing levee located between the
32 expansion site and the BMK south lagoon (see figures 3-1, 3-5, and 3-8 in
33 chapter 3 of this document).

34 Because the final restoration design would include specific design criteria to
35 adequately minimize the potential for lurch cracking and levee displacement
36 during an earthquake, and the conceptual designs for Alternatives 1–3 already
37 incorporate measures to minimize the potential for flooding in the event that the
38 proposed flood control levees are damaged during an earthquake, this impact is
39 considered less than significant.

Impact G-6: Potential Exposure of Levees and Sensitive Wetlands to Tsunamis or Seiches

The expansion site is located adjacent to San Pablo Bay and would contain partially enclosed bodies of water (i.e., tidal marshes) if any of the restoration alternatives are constructed. As such, the expansion site could be subjected to a tsunami or a seiche during the lifetime of the proposed BMKV expansion. However, the projected run-up for seiches and tsunamis with 100-year recurrence intervals is relatively small (≤ 3 feet) (Miller Pacific Engineering Group 1995). The levees proposed under Alternatives 1–3 would be constructed sufficiently high to prevent them from being overtopped by a seiche- or tsunami-induced run-up of this magnitude. Likewise, a seiche or tsunami of this magnitude would likely have little permanent effect on the restored tidal marshes located on the outboard side of the proposed levees. Therefore, this impact is considered less than significant.

1 Surface-Water Hydrology and Tidal Hydraulics

2 This section discusses the physical effects of the restoration alternatives on
3 surface-water hydrology and tidal hydraulics. Potential effects of the proposed
4 BMKV expansion on flood overlay zoning and existing drainage agreements are
5 also discussed in this section.

6 Affected Environment

7 Data Sources

8 The evaluation of hydrology is based on information contained in *Hydrologic*
9 *and Hydraulic Modeling Assessment of Existing and Project Alternatives at Bel*
10 *Marin Keys V* (Northwest Hydraulic Consultants 2002) included as appendix B
11 of this document, as well as the following sources.

- 12 ■ *Hamilton Wetlands Conceptual Restoration Plan* (Woodward-Clyde 1998)
- 13 ■ *Flood and Drainage Baseline Study for Hamilton Army Airfield* (Bissell &
14 Karn/Greiner 1993)
- 15 ■ *Perimeter Drainage Ditch Engineering Evaluation Report, BRAC Property*
16 *Hamilton Army Airfield* (U.S. Army Corps of Engineers 1997)
- 17 ■ Hydrologic Analyses by Philip Williams & Associates, prepared in 1998 as
18 supporting documentation for the Draft Hamilton Wetlands Conceptual
19 Restoration Plan

20 The evaluation of flood zoning and drainage easements is based on the evaluation
21 of hydrology and the language of the existing easements and flood zoning, which
22 are summarized in appendix B and C, respectively, of this document.

23 Information presented in the tidal hydraulics section is based on the following
24 sources.

- 25 ■ *Suspended Particle Transport and Circulation in San Francisco Bay: An*
26 *Overview, in Estuarine Processes—Volume II* (Conomos and Peterson 1977)
- 27 ■ *Wind in California* (California Department of Water Resources 1978)
- 28 ■ *Sacramento–San Joaquin Delta Atlas* (California Department of Water
29 Resources 1993)
- 30 ■ *Sediment Budget Study for San Francisco Bay* (U.S. Army Corps of
31 Engineers 1992)

- 1 ■ Review of Model Plans for the John F. Baldwin Ship Channel Project (U.S.
2 Army Corps of Engineers 1996c)
- 3 ■ Tidal benchmark data (Tide Gage 941-5252)

4 The datum referenced throughout this section is the **National Geodetic Vertical**
5 **Datum of 1929** (NGVD) which is a fixed reference adopted as a standard
6 geodetic datum for elevations determined by leveling. It was formerly called
7 “Sea Level Datum of 1929” or “mean sea level.” Although the datum was
8 derived from the mean sea level at 26 tide stations, it does not necessarily
9 represent local mean sea level at any particular place. (See NOAA Web site:
10 <http://www.ngs.noaa.gov/faq.shtml#WhatVD29VD88>.) Another datum
11 referenced in certain sources is **Mean sea level**, which is a local tidal datum. It is
12 the arithmetic mean of hourly heights observed over the National Tidal Datum
13 Epoch. Shorter series are specified in the name; for example, monthly mean sea
14 level and yearly mean sea level. In order that they may be recovered when
15 needed, such datums are referenced to fixed points known as benchmarks. (see
16 http://il.water.usgs.gov/annrep_2001/misc/cddetion.htm). For this document,
17 elevations (such as levees and water surface levels) are referenced to NGVD.

18 Topography

19 The BMKV site consists of former tidal marshlands that were historically diked
20 and isolated from tidal action to permit agricultural use. Topographic relief in
21 the area is low and gradients are gentle. A regional location map that indicates
22 the location of the major surface-water and tidal channels in the vicinity of the
23 BMKV site is shown in figure 4-2. Ground-surface elevations in the area are
24 now as much as 6 feet below mean tide level (MTL). Subsidence has likely been
25 an indirect result of diking for agricultural use. In the absence of natural tidal
26 action, the shallow sediment column is no longer saturated; consequently,
27 organic matter oxidizes and is reduced in volume, leading to settlement.

28 Perimeter levees separate the BMKV site from San Pablo Bay, Novato Creek, the
29 BMK lagoon, Pacheco Pond, and the HAAF site. Table 4-1 shows levee-top
30 elevations.

1 **Table 4-1.** Elevations of Levees Adjacent to BMKV Expansion Site

Levee Location	Approximate Levee-Top Elevation (Feet NGVD 29)
BMKV Site/San Pablo Bay	6–10
BMKV Site/Novato Creek	5–8
BMKV Site/BMK Lagoon	2–5
BMKV Site/Pacheco Pond	8–11 (with several low spots between 6' and 7' NGVD)
BMKV Site/HAAF Berm	1–5

2
3 A gap is present at the eastern end of the levee segment that separates the BMKV
4 site from the HAAF site. The levee grade in that area has been lowered almost to
5 the surrounding site grade.

6 **Climate**

7 The expansion site and the surrounding area are characterized by a
8 Mediterranean climate with warm, dry summers and cool, wet winters (California
9 State Coastal Conservancy and U.S. Army Corps of Engineers 1998). The
10 climate is strongly influenced by conditions in San Francisco Bay and, to a lesser
11 extent, the Pacific Ocean. July is typically the warmest month, with a mean
12 daytime temperature of approximately 80° F. January is the coldest month, with
13 a mean daytime temperature of approximately 54° F. Differences in minimum
14 and maximum daily temperatures are approximately 30° F in the summer months
15 and 15 to 20° F in the winter (U.S. Army Corps of Engineers 1987).

16 Precipitation near the expansion site ranges from approximately 22 to 30 inches
17 per year, with 90% falling between the months of November and April (U.S.
18 Army Corps of Engineers 1987), primarily in the form of rain. Even in the upper
19 watersheds snowfall is rare, and snowmelt does not contribute significantly to
20 runoff (San Francisco International Airport 2001).

21 Wind-direction frequency plots show a uniform directional distribution. The
22 highest mean wind speeds originate from the northwest (10.4 miles per hour
23 [mph]) and southeast (8.8 mph) (California State Coastal Conservancy and U.S.
24 Army Corps of Engineers 1998).

25 **Surface-Water Drainage Patterns**

26 The expansion site is located in a watershed bounded by the hills of central and
27 northern Marin County (a portion of the California Coast Ranges) to the west and
28 San Pablo Bay to the east (figure 4-2). The upland areas have elevations of
29 1300–1600 feet NGVD 29 and support mixed open grasslands, oak woodlands,

1 and chaparral (California State Coastal Conservancy and U.S. Army Corps of
2 Engineers 1998). The lowlands have elevations as low as several feet below
3 MTL and consist of agricultural fields that were reclaimed from the Bay by
4 levees in the late 1800s.

5 In the San Francisco Bay region, the permeability of both soils and underlying
6 bedrock is typically low. As a result, infiltration rates are slow, runoff rates are
7 correspondingly high and strongly dependent on precipitation, and base flow is
8 poorly sustained. Most streams are ephemeral (San Francisco International
9 Airport 2001).

10 Figure 4-2 shows the major surface-water drainage features on and near the
11 expansion site. They are described in the following sections.

12 **Pacheco Creek**

13 Pacheco Creek drains a watershed of approximately 1.9 square miles. It
14 originates 3 miles west of the HAAF site on Big Rock Ridge; crosses several
15 roadways, including U.S. Highway 101, via culverts; and discharges into
16 Pacheco Pond (California State Coastal Conservancy and U.S. Army Corps of
17 Engineers 1998). Hydrologic studies completed for the Hamilton Airfield
18 Wetland Restoration Plan estimated the 10- and 100-year discharges entering
19 Pacheco Pond at 582 and 1,041 cubic feet per second (cfs), respectively (Philip
20 Williams & Associates 1998).

21 The lower reach of Pacheco Creek is defined as the region downstream of the
22 Northwest Pacific Railroad Bridge crossing. In this reach, overtopping due to
23 downstream backwater effects is known to occur for flows smaller than the 10-
24 year event (California State Coastal Conservancy and U.S. Army Corps of
25 Engineers 1998, Philip Williams & Associates 1998). When flooding occurs,
26 overflow also affects the Las Robles mobile home area adjacent to the business
27 park (California State Coastal Conservancy and U.S. Army Corps of Engineers
28 1998). Overflow was formerly directed toward Landfill 26 and back to Pacheco
29 Pond over the Ammo Hill saddle (Philip Williams & Associates 1998). The U.S.
30 Army constructed a berm around a portion of Landfill 26, the purpose of which is
31 to protect the landfill from overflow from Pacheco Creek up to the level of the
32 100-year flood event (California State Coastal Conservancy and U.S. Army
33 Corps of Engineers 1998). This change directed high flows back along the
34 Pacheco Creek toward its confluence with Arroyo San Jose just north of Ammo
35 Hill.

36 **Arroyo San Jose**

37 Arroyo San Jose drains a watershed of approximately 5.4 square miles. Like
38 Pacheco Creek, Arroyo San Jose has its headwaters on Big Rock Ridge and
39 discharges into Pacheco Pond. The 10- and 100-year discharges are 1,369 and

1 2,455 cfs, respectively (Philip Williams & Associates 1998). Arroyo San Jose
2 accounts for approximately 75% of the inflow to Pacheco Pond (Philip Williams
3 & Associates 1998).

4 Arroyo San Jose is expected to remain within its banks during floods as large as
5 the 100-year event, with the exception of the lower reaches where high stages in
6 Pacheco Pond can cause overtopping due to backwater effects (California State
7 Coastal Conservancy and U.S. Army Corps of Engineers 1998).

8 The project designers reviewed available historic maps and surveys for the
9 project area going back to the mid 1850s. An 1863 U.S. Coast and Geodetic
10 Survey based on an 1854 U.S. Coast and Geodetic Survey shows a fairly wide
11 tidal marsh plain adjacent to San Pablo Bay and Novato Creek, but it does not
12 extend far enough westward to show Arroyo San Jose (U.S. Coast and Geodetic
13 Survey 1863). An 1860 map of Marin County shows Arroyo San Jose entering
14 “salt marsh” in the approximate present-day location of Pacheco Pond and then
15 joining a tidal channel that flows northward and then northeast to enter Novato
16 Creek (Van Dorn 1860). At some point prior to 1914, the existing outlet channel
17 (now just north of Bel Marin Keys Boulevard) was constructed, presumably as
18 part of agricultural reclamation of nearby land (U.S. Geological Survey 1914).
19 As of 1914, a natural channel was still present in a similar location to 1860, and
20 was shown entering Novato Creek in a location north of the present-day railroad
21 bridge at Highway 37 (U.S. Geological Survey 1914). At some point prior to
22 1942, it appears that the natural channel was eliminated, and all of the flow from
23 Arroyo San Jose was rerouted to enter Novato Creek through the existing outlet
24 just north of Headquarters Hill (U.S. Geological Survey 1942). Copies of
25 relevant portions of the referenced maps are included in appendix B.

26 **Pacheco Pond**

27 Pacheco Pond, also known as Ignacio Reservoir, was constructed by the
28 developer of the Ignacio Business Park and deeded to MCFCWCD as a detention
29 basin for flows from Pacheco Creek and Arroyo San Jose. It also provides
30 freshwater wetland and wildlife habitat. MCFCWCD and DFG jointly manage
31 Pacheco Pond.

32 Pacheco Pond covers an area of approximately 120 acres and has an estimated
33 flood storage volume of 866 acre-feet between an elevation of 0 and 7 feet
34 NGVD 29. This volume was estimated by use of topographic data derived from
35 a Light Detection and Ranging (LIDAR) survey conducted in 2000 (San
36 Francisco International Airport 2001). Pacheco Pond discharges into Novato
37 Creek via a leveed channel with an invert elevation of -0.9 feet NGVD 29,
38 controlled by six 4-foot-by-4-foot flap gates. These gates are also known as the
39 Leveroni tidegates.

40 Two 24-inch siphons were installed by the U.S. Air Force to provide an overflow
41 from the pond reservoir onto the HAAF parcel. The siphons were designed to

1 prevent overtopping and damage to the airfield levee, but they are no longer
2 operational (California State Coastal Conservancy and U.S. Army Corps of
3 Engineers 1998).

4 A 36-inch culvert connecting Pacheco Pond and the BMKV site was located in
5 the levee between these two areas. The culvert, which is controlled by a slide
6 gate, appears to be inoperable. The outlet into the BMKV site is perched several
7 feet above the adjacent ground and appears to have been abandoned for many
8 years.

9 Water surface elevations in Pacheco Pond can be controlled by a sill at the
10 upstream face of the Bel Marin Keys Boulevard culvert. The minimum pond
11 elevation can be raised by inserting flashboards on the upstream side of the
12 culvert. An operating agreement between MCFCWCD and DFG establishes the
13 desired water-surface elevation in the pond water at 1.5 feet above mean sea level
14 (MSL). The minimum pond water surface elevation is equivalent to the sill
15 elevation of the culvert (approximately -0.9 feet NGVD 29). Flashboards were
16 not in place during a site inspection completed in January 2002. At the time of
17 the inspection, inflow to Pacheco Pond from Arroyo San Jose and Pacheco Creek
18 was minimal, and the water-surface elevation in the pond was measured at
19 approximately 0.0 feet NGVD 29 in January 2002 (Northwest Hydraulic
20 Consultants 2002).

21 During high-flow events, the water level in Pacheco Pond may exceed the
22 elevation of adjacent levees. The lowest point in the levees (elevation 5.6 feet
23 NGVD 29) is north of the pond, adjacent to the Leveroni property. Overtopping
24 has also been observed near the confluence of the outflow channel with Novato
25 Creek, on the west side of the pond near Ignacio Business Park, further upstream
26 at the Las Robles mobile home park, and along the westerly levee near
27 Headquarters Hill (Philip Williams & Associates 1998; California State Coastal
28 Conservancy and U.S. Army Corps of Engineers 1998).

29 **Novato Creek**

30 Novato Creek is the principal drainage in the vicinity of the expansion site and
31 has an approximate total watershed area of 44 square miles (U.S. Army Corps of
32 Engineers 1987). The Corps has computed 10- and 100-year discharges near the
33 Highway 101 crossing of 3,420 cfs and 6,230 cfs, respectively (U.S. Army Corps
34 of Engineers 1987), and recognizes an “ultimate flow” of 8,000 cfs at the mouth
35 of Novato Creek. However, the lower channel and the railroad bridges
36 downstream of Highway 101 and adjacent to Highway 37 constrict the flow,
37 causing overtopping upstream of the lowest reach of Novato Creek and reducing
38 the actual discharge in the lower reaches of the creek. The 8,000-cfs value in
39 particular is unlikely to pertain to the reaches of Novato Creek adjacent to the
40 BMKV site (Presidio Group 1996).

1 Recent modeling efforts have shown that the tidal influence extends upstream of
2 Highway 101 to the City of Novato during flows greater than the 10-year event
3 (Philip Williams & Associates 1998). During storm periods, the maximum water
4 surface elevation observed at the Highway 37 crossing was approximately 7 feet
5 NGVD 29 (Philip Williams & Associates 1998).

6 Top-of-levee surveys completed in 1996 indicate that the levee crest between
7 Novato Creek and the BMKV site dips to an elevation of approximately 5.6 feet,
8 NGVD 29, at a point approximately 1000 feet downstream from the BMK south
9 lagoon navigation lock (Jones & Stokes 1996). Overtopping of this levee was
10 observed by BMK residents in the February 1998 flood event.

11 Downstream of Highway 101, the geometry of Novato Creek is characteristic of
12 tidally influenced channels throughout San Francisco Bay and is composed of a
13 consolidated bay mud main channel with tidal salt marsh benches. The slope of
14 the lower channel is relatively mild, with a general longitudinal slope of 0.002
15 feet per foot between Highway 101 and Diablo Avenue to approximately 0.0001
16 feet per foot near the mouth. Novato Creek transitions from channel-control to
17 tidal-control within this reach, as the slope of the creek reduces and the creek
18 elevations come within San Pablo Bay tidal range. Tidal effects from San Pablo
19 Bay become apparent and influence the stage of the creek, as the creek stage rises
20 and falls with the tidal stage in San Pablo Bay. The location of the transition
21 point from channel-control to tidal-control varies with the magnitude of
22 terrestrial inflows and tide stage characteristics. Channel conveyance and thus
23 discharge capacity in lower Novato Creek is directly related to the tide level.
24 Since both the tide stage and inflows to Novato Creek vary with time, the
25 channel conveyance also varies with time.

26 From the Northwestern Pacific Railroad (NPRR) bridge east of Highway 101, the
27 existing Novato Creek channel is relatively narrow. Using HEC-2, a steady-state
28 hydraulic model developed by the Corps, the Federal Emergency Management
29 Agency (FEMA) calculated a maximum channel conveyance capacity
30 downstream of the NPRR bridge of 2,500 cfs (Federal Emergency Management
31 Agency 1989). It is worth noting that this is significantly less than the effective
32 10-year peak discharge of 3,420 cfs published in the City of Novato flood
33 insurance study (FIS) (Federal Emergency Management Agency 1989). When
34 flows exceed channel capacity, over-bank flow over the surrounding levees
35 occurs starting with the low points of surrounding levees. This over-bank flow
36 has occurred previously into the agricultural areas between the NPRR bridge and
37 Highway 37, as well as in the agricultural areas between Highway 37 and the
38 mouth of the creek.

39 The 1984 City of Novato Flood Insurance Rate Map (FIRM) published by FEMA
40 indicates a nearly flat water surface coincident with the peak 100-year tidal stage
41 in the lower reach of Novato Creek, which reveals the dominance of tidal
42 flooding over terrestrial flooding in Novato Creek downstream of Highway 37
43 for the 1% annual exceedance probability (100-year recurrence interval) flood.

1 Tidal cycles during storm events reduce the available channel capacity to drain
2 riverine flows, which exacerbates and increases flood stage in the creek channel.

3 Over the last 2 centuries, hydrologic conditions in the Novato Creek watershed
4 below Highway 37 have varied dramatically due to changes in land use practices
5 and engineered modifications to the land surface. These modifications include
6 the construction of flood protection levees, the development of Pacheco Pond as
7 a flood detention system, and the rerouting of drainage channels and installation
8 of flap gates on Simmons Slough and Pacheco Pond. This has decreased the tidal
9 prism of lower Novato Creek significantly and has resulted in accretion of the
10 channel. Comparisons of recent topographic and bathymetric surveys (Towill
11 1971 and 1996) to survey mapping from the 1800's (U.S. Coast and Geodetic
12 Survey 1863, 1887, 1889, and 1899) show dramatic reductions in channel width.
13 The reduction in channel size due to accretion has decreased the flood capacity of
14 the system and has proved undesirable for navigation. The creek is constantly
15 evolving toward a smaller width and depth consistent with the reduced tidal
16 prism. Actions to counter the effects of channel accretion include the periodic
17 surveying and raising of levees along the north side of Novato Creek from
18 Highway 37 to the mouth of the creek, and dredging of Novato Creek
19 downstream of its confluence with Pacheco Pond.

20 **Bel Marin Keys Development**

21 The BMK development is located adjacent to the northwest boundary of the
22 expansion site. BMK is a waterfront residential community with 2 internal
23 constructed lagoons that offer access to Novato Creek through a system of locks.
24 The BMK community uses Novato Creek for boat access to San Pablo Bay and
25 relies on tidal changes in water level to periodically exchange flow between the
26 BMK lagoons and San Pablo Bay. Storm drainage to the lagoons is aggravated
27 by coincident high Novato Creek stages, caused either by high San Pablo Bay
28 tides or high Novato Creek discharge, with high amounts of local precipitation
29 over the BMK development. High water stages in Novato Creek due to high
30 tides and/or high flows from the Novato Creek watershed have resulted in
31 overtopping of the north lagoon lock tainter gates and low portions of the levee
32 adjacent to the south lagoon lock (Tweed pers. comm.).

33 Water level is managed at 2 feet NGVD 29 in the north lagoon and 0.5–1 foot
34 NGVD 29 in the south lagoon (Presidio Group 1996). Stormwater is discharged
35 to Novato Creek via the boat access lock. Discharge into Novato Creek is
36 limited by stage in the creek; during high-flow periods, runoff is impounded in
37 the lagoons until flow recedes (Presidio Group 1996).

38 Stormwater from the south lagoon can also be discharged onto BMKV via
39 culverts in the levee on the eastern edge of the south lagoon. In 1997, the former
40 owner of the BMKV property granted the BMK Community Services District
41 (CSD) the right to construct, maintain, and repair an emergency spillway on the
42 existing levee, the purpose of which is to relieve high water in the lagoon

1 surrounding Units III and IV of the BMK subdivision. This agreement also
2 granted the right to discharge water onto a 3-acre portion of one of the BMKV
3 parcels p from the lagoon when the lagoon and Novato Creek reach a level of 1.5
4 feet NGVD (see appendix E). At present, the conveyance structure for flow from
5 the BMKV south lagoon to the adjacent part of the BMKV property consists of a
6 weir and three 12-inch culverts. The low point on the BMKV south
7 lagoon/BMKV levee is approximately 2 feet NGVD, so it is also possible for
8 flow to overtop the south lagoon levee and flow onto BMKV. Most of the south
9 lagoon/BMKV levee elevation is approximately 5 feet NGVD.

10 The BMK CSD periodically dredges the lagoons to remove sediment that settles
11 in the lagoons. This dredging is in addition to the aforementioned dredging of
12 the Novato Creek channel for navigation. The BMK CSD also periodically
13 (approximately once to twice monthly) flushes the lagoons both to maintain
14 water quality in the lagoons and to promote scour in the lower Novato Creek
15 channel to favor navigation (Krone 1989) The flushing procedure, while
16 promoting scour, has not eliminated the need for maintenance dredging, and the
17 BMK CSD is presently planning for an upcoming dredging event.

18 **Hamilton Army Airfield**

19 The former HAAF property is located south of the BMKV site. The HAAF site
20 receives flood overflows from Pacheco Creek via 48- and 24-inch flap gates that
21 serve the Landfill 26, Ammo Hill, and POL Hill areas. However, prior to 1999,
22 the Army completed construction of a berm around a portion of Landfill 26 to
23 protect the landfill from overflow from Pacheco Creek up to the 100-year flood.
24 (HAAF BRAC Environmental Office 2001.) Historically, HAAF also received
25 overflows from Pacheco Pond via 2 slide-gated siphons. These siphons are no
26 longer operational (Philip Williams & Associates 1998). Flood overflows also
27 enter the HAAF site from the BMKV parcel through a levee gap approximately
28 2,000 feet southeast of the HAAF site's northwest corner.

29 Conceptual design for the HAAF tidal wetland restoration feasibility study (U.S.
30 Army Corps of Engineers 1998) suggested that the connection between HAAF
31 and Pacheco Pond may change. The specific design of any modified drainage
32 between Pacheco Pond and HAAF has not been determined at this time. No
33 modifications to the connection between Pacheco Pond and HAAF are proposed
34 as part of the BMKV expansion.

35 **Tides**

36 Tides in San Pablo Bay follow a mixed semidiurnal cycle, with 2 high tides of
37 unequal elevation and 2 low tides of unequal elevation per day. Average high
38 tide elevation values are referred to as mean higher high water (MHHW) and
39 mean high water (MHW). Similarly, low tide peaks are referred to as mean low
40 water (MLW) and mean lower low water (MLLW). Events such as storm high

1 tides that exceed the elevation of MHHW are referred to as extreme high tide
2 (EHT).

3 Because of geographic and hydrodynamic complexities, tidal characteristics,
4 including the elevations of average high, low, and mean tides, differ substantially
5 throughout the San Francisco Bay–San Pablo Bay system. Tide cycles in San
6 Pablo Bay typically lag behind those at the Golden Gate by as much as 75
7 minutes (U.S. Army Corps of Engineers 1996). However, within San Pablo Bay
8 itself, comparison of tide levels within Novato Creek and at the mouth of the
9 Petaluma River indicates that the lag time is negligible between these sites
10 (Philip Williams & Associates 1998).

11 Table 4-2 shows statistical tidal information for the expansion site, obtained from
12 measurements made by the National Oceanic & Atmospheric
13 Administration/National Ocean Survey (NOAA/NOS) at the mouth of the
14 Petaluma River (Tide Gage #941 5252) (NOAA/NOS 2002). Table 4-2 also
15 shows the expected elevation of a 100-year tide in San Pablo Bay. The 100-year
16 tide represents a tide that has a 1-in-100 (or 1%) chance of occurring in any given
17 year.

18 **Table 4-2.** Tide Information from the Petaluma River Entrance

Tide Level	Feet above MLLW Datum	Feet above NGVD 29 Datum
100-Year Event (SF COE) ¹	9.13	6.50
MHHW ²	6.06	3.43
MHW ²	5.49	2.86
MTL ²	3.24	0.61
NGVD 1929 ²	2.63	0.00
MLW ²	1.00	-1.63
MLLW ²	0.00	-2.63

Note: datums do not take into account sea-level rise or wave runup.

Sources:

¹ U.S. Army Corps of Engineers 1984

² NOAA/NOS 2002

19
20 Tide data recently collected by San Francisco International Airport’s Airfield
21 Development Engineering Consultant (ADEC) (2000) at the mouth of the
22 Petaluma River correspond closely to the NOAA/NOS data shown in table 4-2.
23 The ADEC data consist of water surface measurements taken at 10-minute
24 intervals over a 30-day period from June 15, 2001 to July 15, 2001. The MHW
25 computed from the ADEC data is 0.14 foot below the value reported by NOAA;

1 the MLW computed from the ADEC data is 0.07 foot above the value reported
2 by NOAA.

3 **Sediment Budget**

4 The sediment budget in the San Francisco Bay–San Pablo Bay system is a key
5 factor in restoration design because it relies on natural delivery of sediment to
6 transform the basin created by restoration efforts into a functioning, mature
7 marshland over time. The fine-sediment fraction (suspended load and fine bed
8 load) is particularly important because it provides the primary sedimentary
9 building blocks for naturally evolving tidal marsh regimes. The following
10 sections provide additional information on sediment loading in the Bay system,
11 with a focus on the fine (suspended load) fraction.

12 **Overview of Suspended-Sediment Loading in the San** 13 **Francisco Bay Estuary**

14 Like salinity, suspended-sediment concentration is controlled by a balance of
15 factors. Important influences on suspended-sediment loading include wind speed
16 and direction (i.e., the magnitude of wind-driven waves and strength of wave
17 currents), freshwater influx, and tidal currents (Northwest Hydraulic Consultants
18 2001). Freshwater influx shows a strong seasonal variation, with a peak during
19 the winter (November–April) rainy season; land-derived sediment loading shows
20 a corresponding peak in the winter. Tidal currents vary on a semi-monthly basis
21 from neap tides to spring tides, with the greatest sediment mobility at spring
22 tides.

23 Throughout the year, suspended-sediment concentrations are generally highest in
24 the North Bay region and at the southern end of the Bay. USGS data show
25 average concentrations of approximately 80–150 milligram/liter (mg/l) in San
26 Pablo Bay for water years 1997 and 1998 (USGS 1999 and USGS 2000).
27 Sediment concentrations are typically lower in the central portion of the Bay
28 (Northwest Hydraulic Consultants 2001).

29 Many of the North Bay’s sloughs are fed by relatively small creeks. Measured
30 sediment concentrations in these sloughs range from 41 to 386 mg/l and typically
31 decrease with increasing distance from San Pablo Bay (Warner and
32 Schoellhammer 1999, Buchanan and Ruhl 2000) because the Bay is their primary
33 source of sediment. By contrast, the larger Petaluma River system carries a
34 substantial suspended-sediment load because of its larger watershed.
35 Sedimentation rates at locations on the margin of San Pablo Bay near the river
36 mouth (e.g., Bel Marin Keys, Port Sonoma Marina, and Petaluma Marsh) are as
37 much as 0.5–1.3 feet per year (U.S. Army Corps of Engineers 1998).

1 **Flood Overlay Zoning**

2 The Marin County Zoning map currently designates an 8-acre portion of the
3 BMKV site along Novato Creek as an F-1 (primary floodway) overlay zone, with
4 the remainder of the site designated as an F-2 (secondary floodway) overlay zone
5 (see figure 4-3). A large portion of the surrounding areas in the lower Novato
6 Creek watershed are also designated F-2 (see figure 4-4).

7 The F-1-designated zone is north of the northern levee of the site and on a small
8 area in the northwestern corner of the site that faces Novato Creek. The purpose
9 of the F-1 zone is to protect life and property within the designated zone and to
10 prevent random, uncontrolled development from impeding passage of
11 floodwaters and increasing flooding. No dredging, filling, or levee or dike
12 construction is permitted within F-1 zones if it would increase the water-surface
13 level or impede the flow of water within the zone.

14 The F-2-designated zone covers the remainder of the BMKV site. The purpose
15 of the F-2 zone is to protect life and property and to prevent random,
16 uncontrolled development from increasing flooding by decreasing the capacity of
17 secondary floodplains to receive overflow floodwaters. No buildings, dredging,
18 filling, or levee or dike construction is permitted within F-2 zones if it would
19 reduce or eliminate the ponding capacity of the land within the F-2 zone by more
20 than 25%. If the ultimate flood control channel improvements (described below)
21 were made to Novato Creek, as defined by the MCFCWCD, or if an alternate
22 method of providing flood control facilities for the zone, equal in capacity to the
23 ultimate channel improvements, was established, then full use of the site would
24 be allowed. The ultimate channel improvements consist of constructing a
25 specified channel along Novato Creek from Highway 101 to San Pablo Bay that
26 is designed to contain approximate 100-year flood events within the channel.

27 **Drainage Agreements and Easements**

28 The BMKV site is subject to 3 drainage agreements and easements relevant to
29 the expansion (see figure 4-4).

30 The BMK Unit IV development is an approximately 100-acre area located in the
31 southwest portion of the larger BMK residential development area. To facilitate
32 the development of BMK Unit IV within the F-2 zone, a drainage agreement was
33 recorded in 1980 that allowed the development of BMK IV to proceed, provided
34 that a 300-acre area (Area 1 on figure 4-4) was preserved for flood protection
35 purposes on BMKV. The agreement was between the former owner of the
36 BMKV property and MCFCWCD, and specified that the owner of the 300-acre
37 area on BMKV could not fill or otherwise prevent flood-water ponding and could
38 not use the area in a manner that would cause additional flooding to other
39 properties in the vicinity. Provisions of this agreement remain in full force until
40 Novato Creek ultimate channel improvements occur or equivalent measures are
41 implemented.

1 A second drainage agreement was established in 1986 to facilitate the placement
2 of dredged materials by BMK CSD on several fallow fields in the northeast
3 corner of BMKV (Area 2 on figure 4-4). This agreement was between BMK
4 CSD, MCFCWCD, and the owner of the BMKV parcel, and required the owner
5 of BMKV to maintain a 70.2-acre area (Area 3 on figure 4-4) for ponding
6 purposes to compensate for the loss of ponding capacity in the dredged material
7 placement area. Other areas can substitute for Area 3 if the replacement ponding
8 area has a ponding volume as great or greater than that of Area 3; the substitution
9 ponding area won't flood other property in the area; and MCFCWCD agrees.
10 The agreement conditions can also be lifted if the owner moves all or part of the
11 dredged material fill to another location, which would release the obligation to
12 retain Area 3 for flood-water ponding as long as the owner provided an
13 engineered plan that is satisfactory to MCFCWCD. Provision of this second
14 agreement remains in force until the Novato Creek ultimate channel
15 improvements occur, equivalent storage is provided, or all government agencies
16 have issued permits for the development of parcels adjacent to the dredged
17 material area and Area 3.

18 In 1997, the owner of the BMKV property provided an easement (Marin County
19 Recorders Serial No. 97-000917) to BMK CSD to construct, maintain, and repair
20 an emergency spillway on the south lagoon levee (location 4 on figure 4-4). The
21 purpose of this emergency spillway is to relieve high water in the south lagoon
22 surrounding the BMK subdivision. The easement granted the right to discharge
23 overflow water from the south lagoon to a 3.0-acre portion of Parcel 157-172-07,
24 when the lagoon and Novato Creek reach a level of 1.5 feet NGVD. The
25 easement provides for removal of the easement if a project on the BMKV
26 property includes flood control measures, such as levees of sufficient height, to
27 contain the high water in the lagoons surrounding Units III and IV of the BMK
28 subdivision. It should be noted that the easement makes no mention of and is
29 unrelated to the other 2 easements (for 300 acres and 70 acres) mentioned above.

30 **Flood Zone Mapping and Flood Insurance**

31 This section summarizes the National Flood Insurance Program (NFIP) and flood
32 mapping of the project area and the adjacent BMK residential area. This section
33 has been added since the Draft SEIR/EIS because a number of commenters asked
34 how the proposed project related to flood zone mapping and flood insurance
35 rates.

36 FEMA manages the NFIP. There are 3 components of the NFIP: (1) flood
37 hazard mapping, (2) floodplain management, and (3) flood insurance.
38 Engineering studies, referred to as FISs, are conducted to characterize flooding
39 risks within a community by identification of base flood elevations (BFE). The
40 BFEs are the elevations of the 100-year storm event (referred to as the base
41 flood) identified in the FIS. The results of the FIS are used to identify special
42 flood hazard areas (SFHA), which are areas that the FIS indicated would be

1 inundated by the 100-year storm event. These areas are then identified in
2 FIRMs.

3 Communities participate in the NFIP by adopting and enforcing floodplain
4 management ordinances to reduce future flood damage. In exchange, the NFIP
5 makes federally backed flood insurance available to homeowners, renters, and
6 business owners in these communities. Marin County (within which the BMKV
7 site and the BMK community are located) is a participant in the NFIP with
8 MCFCWCD as the local community agency responsible for floodplain
9 management. To get secured financing to buy, build, or improve structures in an
10 SFHA, homeowners are required to purchase flood insurance. Flood insurance is
11 not mandatory outside the SFHA. Flood insurance rates are determined based on
12 the risk zone identified on the FIRMs.

13 FEMA conducted a FIS for the unincorporated parts of Marin County, including
14 the BMKV site and the BMK residential area in 1972, published a flood hazard
15 boundary map in 1977 and published a FIRM in 1982 (FEMA 1982 and 1986).
16 FEMA completed an additional FIS for the unincorporated parts of Marin County
17 in 1986, but did not update the FIRM for the BMKV site (FEMA 1986). FEMA
18 also completed an FIS for the City of Novato (including areas adjacent to the
19 BMKV site and the BMK residential area) and published associated FIRMs in
20 1989 (FEMA 1989a and 1989b). The FIRMs for the relevant parts of
21 unincorporated Marin County (Panels 0601730259 and 0601730300) identify the
22 BMKV site as within the A1 zone (BFE of 6 feet NGVD) (Federal Emergency
23 Management Agency 1982 and 1989b). The BMK residential area is identified as
24 located within the C zone [which is not a flood hazard zone], with the exception
25 of a low-lying area along Novato Creek and the BMK lagoons, which are located
26 within the A1 zone (BFE of 6 feet NGVD) (FEMA 1982). The FIRM for the
27 City of Novato (parcel 0601780005) shows Pacheco Pond as within the AE zone
28 (BFE of 8 feet NGVD) (FEMA 1989b). The BMKV site, the BMK lagoons, and
29 Pacheco Pond are mapped as within SFHAs; the BMK residential area and
30 Headquarters Hill are not. Flood insurance is available for BMK residences
31 within the C zone, but it is not required by regulation in this zone. Copies of
32 relevant portions of the local FIRMS are included in appendix C.

33 Local floodplain management regulations are required to meet the minimum
34 standards found in FEMA regulations, which are located in 44 Code of Federal
35 Regulations (CFR) Section 60. As identified in 44 CFR Section 60.12, for state-
36 owned properties in special hazard areas, the state is required to either (1) comply
37 with the floodplain management requirements of a local community within which
38 the state-owned properties are located, or (2) establish and enforce floodplain
39 management regulations that satisfy the minimum criteria found in FEMA
40 regulations (44 CFR 60.3, 60.4, and 60.5). Floodplain management criteria for
41 flood-prone areas are presented in 44 CFR Section 60.3. In Section 60.3(d)(3),
42 the FEMA regulations identify that construction (including fill) should be
43 prohibited in the regulatory floodway unless it is demonstrated through
44 hydrologic/hydraulic studies that the proposed encroachment would not increase
45 flood levels.

Environmental Consequences and Mitigation Measures

Approach and Methods

Hydrologic resources and surface-water drainage patterns in the expansion area have been documented extensively in previous work (Northwest Hydraulic Consultants 2002, U.S. Army Corps of Engineers 1989 and 1997, Bissell & Karn/Greiner 1993, unpublished U.S. Army Corps of Engineers data, Woodward-Clyde 1998, and associated background information). The potential environmental consequences of the restoration alternatives on hydrological resources have been evaluated primarily through review and analysis of available information. Based on an understanding of present hydrologic conditions, the potential impact mechanisms were identified. Potential impacts were then identified based on these impact mechanisms, and additional technical analysis was conducted where required to quantify or mitigate impacts associated with the proposed BMKV expansion.

To assess the impacts of tidal wetland restoration on the hydrology of the site, Northwest Hydraulics Consultants completed hydrologic and hydraulic modeling studies that assessed the effects of proposed expansion activities, such as Pacheco Pond and tidal wetland modifications, on flooding conditions along Novato Creek and Pacheco Pond. These studies were based on a review of hydrological studies of the Novato Creek and Pacheco Pond watersheds. Existing and potential future site conditions that affect the drainage and flooding characteristics were identified. Representative flood hydrographs and tidal stage characteristics were determined and used for computing flood stage and discharge conditions in the study area. To quantify the changes in flood stage and discharge magnitude resulting from coincident terrestrial and tidal flood conditions, a one-dimensional, unsteady flow model of the Novato Creek and Pacheco Pond system was developed. The modeling approach and results are discussed in greater detail in appendix B.

Potential impacts on the tidal hydraulic regime and morphology of San Pablo Bay and its environs were determined by comparing the magnitude of the relevant tidal hydraulic parameters under existing conditions with the expected magnitude of the tidal hydraulic parameters after implementation of the various restoration alternatives.

Effects of the proposed BMKV expansion on flood overlay zoning and existing drainage agreements and on flood mapping and flood insurance are also discussed separately in this section.

Impacts to hydrology are identified as Impact HYD-#; impacts to tidal hydraulics are identified as Impact TH-#.

1 **Impact Mechanisms**

2 **Hydrology**

3 The following types of activities and processes associated with implementation
4 of the restoration alternatives could result in changes in flooding and surface-
5 water drainage in the vicinity of the expansion area.

6 **Conversion of Existing Diked Agricultural Fields to Tidal Marsh**

7 The restoration alternatives would convert existing diked lowlands in the
8 expansion area to tidal wetland. The restored tidal wetland area would be subject
9 to the tidal elevations characteristic of San Pablo Bay. Outboard levees along
10 San Pablo Bay and Novato Creek would be breached and/or lowered to facilitate
11 tidal wetland creation and tidal flows. The impact mechanisms for the proposed
12 BMKV expansion include the effects of placing fill on existing drainage facilities
13 for adjacent property and the effects of opening formerly diked areas to tidal
14 flow.

15 **Modification of Pacheco Pond and Pacheco Pond Outlet Facilities**

16 The restoration alternatives would enlarge the dimensions of Pacheco Pond
17 and/or provide for overflow of the pond to a seasonal wetland area. A new pond
18 outlet would be constructed to allow discharge from Pacheco Pond to flow to
19 either the tidal marsh restoration area (Alternatives 1 and 3) or the seasonal
20 marsh restoration area (Revised Alternative 2) through a conveyance structure.
21 The impact mechanisms for the proposed BMKV expansion include the effects
22 on altered flood-storage characteristics of Pacheco Pond and changes in pond
23 drainage conditions no longer influenced by water surface stage conditions
24 within Novato Creek.

25 Pacheco Pond is owned by MCFCWCD and is operated under a joint agreement
26 between DFG and MCFCWCD (Marin County Flood Control and Water
27 Conservation District and California Department of Fish and Game 1980). As
28 described in chapter 3, as part of the BMKV expansion, the Corps, Conservancy
29 or their successors, in cooperation with MCFCWCD and DFG, would develop a
30 new water management plan for Pacheco Pond to continue the purposes of flood
31 control and wildlife habitat conservation for which the pond was built. Potential
32 diversion of some or all of the discharge from Pacheco Pond in the wet season
33 would potentially change flow and stage conditions within Novato Creek (see
34 discussion in the impact analysis below). Responsibilities for maintenance of the
35 Pacheco Pond facilities and outlet structures would be determined as part of the
36 development of a new water management plan.

37 **Tidal Hydraulics**

38 The following types of activities and processes associated with implementation
39 of the restoration alternatives could result in changes in tidal hydraulic

1 circulation or morphologic processes in Novato Creek, San Pablo Bay, or the
2 restored tidal wetlands in the expansion area.

3 **Tidal and Residual Circulation in San Pablo Bay**

4 Creation of an additional tidal prism on the western shoreline of San Pablo Bay
5 would induce tidal currents into and out of the tidal prism of the restored tidal
6 wetland. This action could alter circulation patterns within San Pablo Bay.

7 **Morphology of San Pablo Bay Shoreline and Novato Creek**

8 The proposed BMKV expansion would involve construction of tidal outlet
9 channels through the existing outboard salt marsh and mudflats. Additional
10 morphologic adjustments and changes within San Pablo Bay and Novato Creek
11 could develop over time.

12 **San Pablo Bay Sediment Budget**

13 The proposed BMKV expansion is designed to trap suspended sediment from
14 San Pablo Bay and Novato Creek. Sediment deposition within the restored
15 wetlands may affect the overall sediment budget and existing sediment
16 deposition patterns within San Pablo Bay.

17 **Tidal and Residual Circulation in Restored Tidal Wetlands**

18 The proposed BMKV expansion would create tidal circulation and inundation on
19 properties that are presently protected by levees and drained by the existing
20 HAAF pump stations and perimeter drainage ditch.

21 **Internal Peninsulas and Perimeter Levees**

22 The proposed BMKV expansion would create tidal currents adjacent to the
23 internal peninsulas and the expansion site perimeter levee. Tidal inundation
24 would allow for wind-wave action on these structures that could induce erosion
25 or morphologic change over time.

26 **Thresholds of Significance**

27 The following significance criteria were used to evaluate the proposed BMKV
28 expansion. Regarding surface hydrology, the proposed expansion was identified
29 as resulting in a significant impact on the environment if it would

- 30 ■ substantially alter drainage patterns, flow rates, or volumes;
- 31 ■ increase the risk of flood peaks or volumes that would damage infrastructure
32 or property or endanger public safety;
- 33 ■ result in hydrologic changes that could adversely affect existing or planned
34 biological communities;
- 35 ■ result in the need for new drainage facilities and capital expenditures; or
- 36 ■ increase the potential for erosion or sediment deposition.

1 Regarding tidal hydraulics, the proposed expansion was identified as resulting in
2 a significant impacts on the environment if it would

- 3 ■ alter the magnitude and direction of tidal circulation outside the immediate
4 zone of subtidal and outboard marsh channels constructed for the project;
- 5 ■ alter the large-scale morphology of mudflats and subtidal channels outside
6 the immediate zone of subtidal and outboard marsh channels constructed for
7 the project;
- 8 ■ cause erosion of the perimeter levees, thus increasing the risk of tidal
9 flooding on adjacent properties;
- 10 ■ induce or aggravate erosion of the existing outboard salt marsh;
- 11 ■ cause insufficient sediment deposition within the tidal marsh to develop
12 morphologically as proposed; or
- 13 ■ cause long-term persistence of internal peninsulas.

14 In addition to these criteria, the consistency of the restoration alternatives and
15 existing flood zoning designations and drainage agreements were considered
16 when evaluating the significance of potential project effects on hydrology.

17 **Impacts and Mitigation Measures of No-Action** 18 **Alternative**

19 Maintaining the BMKV parcel in its present condition would result in no impacts
20 on the surface-water hydrology of San Pablo Bay and Novato Creek. The
21 Conservancy would continue to maintain the property in caretaker status.
22 Operation and maintenance of Pacheco Pond and its appurtenances and the
23 interior drainage system of the BMKV site would continue. The existing
24 surface-water drainage characteristics of Pacheco Pond, Novato Creek, the BMK
25 community, and the BMKV site would be unaffected.

26 Maintaining the BMKV site in its present condition would result in no impacts
27 on the tidal hydraulic environments of San Pablo Bay and Novato Creek. The
28 existing outboard tidal marshes, mudflats, and subtidal channels of San Pablo
29 Bay would be unaffected.

Impacts and Mitigation Measures Common to Alternatives 1–3

Impact HYD-1: Potential for Change in Peak Stage in Pacheco Pond

As part of the restoration alternatives, the physical dimensions of Pacheco Pond would be enlarged and provide additional storage capacity of the Pond. The restoration alternatives also entail the construction of a new connection between Pacheco Pond and the BMKV site, and the potential diversion of some or all flow from the existing outlet of Pacheco Pond to Novato Creek to the BMKV site. Diverting the flow to BMKV would reduce Pacheco Pond stages during flood events by eliminating constraints on existing Pacheco Pond drainage imposed by high Novato Creek stages that occur during coincident flooding events. High Novato Creek stages control Pacheco Pond flap-gate (also known as the Leveroni tidegate) operations under existing conditions, limiting the duration and magnitude of discharges from the gates. Under Alternatives 1 and 3, the enlarged Pacheco Pond would be directly connected to the restored tidal marsh and San Pablo Bay. Therefore, operation of the new flap gates would be constrained only by San Pablo Bay tide stage and not by coincident Novato Creek and tidal flooding conditions. Revised Alternative 2 proposes an overflow connection between an expanded Pacheco Pond and a seasonal wetland basin. The expanded pond and the seasonal wetland basin would provide additional flood storage capacity for the Pacheco Pond system and ultimately discharge directly to the restored tidal marsh and San Pablo Bay.

Under Alternatives 1 and 3, Pacheco Pond would be expanded to a capacity of approximately 1,241 acre-ft (above 0-ft, NGVD 29), with flow diverted to restored tidal marsh through a flap-gated culvert structure with an invert of 1.5' NGVD. This would be an increase of 375 acre-ft above existing capacity. Under Revised Alternative 2, Pacheco Pond would be expanded through the addition of an expansion of the pond/emergent wetland (33 acres in total) with a capacity (below 7' NGVD) of about 175 acre-ft. A seasonal wetland would be constructed adjacent to the expanded pond, with a storage volume of approximately 400 acre-ft up to 1.5' NGVD, 650 acre-ft up to 3.5' NGVD, and higher capacity if filled beyond 3.5' NGVD (see calculations in Appendix B). Under Revised Alternative 2, the connection to the new seasonal wetland area would be set at approximately 1.5 feet NGVD, which would allow flow at much lower stage levels than at present.

The hydrologic conditions considered in the analysis of the restoration alternatives consisted of 2 scenarios. These scenarios, referred to here as Inflow Conditions A and B, are based on available data and are meant to approximate the 10- and 100-year storm events for existing conditions, respectively. However, a comprehensive statistical evaluation of precipitation, watershed conditions, and runoff was not performed to identify the inputs for these

1 scenarios. The results of the modeling of Pacheco Pond elevations are presented
2 below in table 4-3 and discussed in greater detail in appendix B.

3 **Table 4-3. Peak Water Surface Elevations in Pacheco Pond (feet NGVD 29)**

Case	Inflow Condition A	Inflow Condition B
Existing	6.4	7.6
Alternative 1 & 3	4.5	7.2
Revised Alternative 2	4.6	6.3

4
5 Reducing flood stage within Pacheco Pond would reduce water-surface
6 elevations in the lowermost reaches of both Pacheco Creek and Arroyo San Jose,
7 which would enhance surface-water drainage characteristics within the Ignacio
8 Business Park. Since the proposed BMKV expansion would reduce the risk of
9 flooding in Pacheco Pond and the Ignacio Business Park, this impact is
10 considered beneficial.

11 **Impact HYD-2: Potential Change in Pacheco Pond Peak**
12 **Drainage**

13 The restoration alternatives propose to increase the storage capacity of Pacheco
14 Pond and redirect some or all of the outlet flows of the pond through a
15 hydrologic connection to the restored tidal marsh (or an overflow structure to the
16 seasonal wetland area in Revised Alternative 2 and then to the tidal marsh area)
17 and then to San Pablo Bay, thereby reducing potential constraints on pond
18 drainage imposed by high stages within Novato Creek. These modifications
19 would result in reduced stages within Pacheco Pond for all combinations of
20 Novato Creek, Pacheco Pond watershed, and tidal flooding conditions assessed in
21 the conceptual restoration design. Since Pacheco Pond stages would be reduced
22 during flooding events for all restoration alternatives, this impact is considered
23 beneficial.

24 **Impact HYD-3: Potential Change in Pacheco Pond**
25 **Overflows into the Leveroni Property**

26 The restoration alternatives propose to increase the storage capacity of Pacheco
27 Pond and redirect some or all of the outlet flows of the pond to the restored tidal
28 marsh (or seasonal wetland and then tidal marsh in Revised Alternative 2) and
29 San Pablo Bay through a flap-gated culvert, thereby eliminating any potential
30 constraints on pond drainage imposed by high stages within Novato Creek.
31 These modifications would result in reduced stages within Pacheco Pond for all
32 combinations of Novato Creek, Pacheco Pond watershed, and tidal flooding
33 conditions assessed in the conceptual restoration design. They would also result
34 in reduced frequency of overtopping events of the existing Leveroni Property
35 levee for all restoration alternatives. This impact is considered beneficial.

1 **Impact HYD-4: Potential Change in Novato Creek Peak**
2 **Flood Stage**

3 The restoration alternatives would redirect some or all of the Pacheco Pond outlet
4 flows from Novato Creek to a flap-gated culvert that flows directly to the
5 restored tidal wetland (or seasonal wetland in Revised Alternative 2) and San
6 Pablo Bay. This modification would reduce flows into the lower reach of Novato
7 Creek, reducing flood stage in Novato Creek during coincident Pacheco Pond
8 and Novato Creek flood events.

9 To examine the effect of this diversion, stage hydrographs at select locations
10 along Novato Creek are presented in figures 4-5 and 4-6, for Inflow Conditions A
11 and B, respectively. The locations chosen include the upstream limit of the
12 model at the Highway 37 bridge (CS 10), at the existing confluence of Pacheco
13 Pond with Novato Creek (CS 8), and near the location of the proposed design
14 breach (CS 2.8).

15 The stage hydrographs shown in these figures suggest that peak water-surface
16 elevations within Novato Creek are controlled primarily by tidal fluctuations.
17 That is, the effects of diverting Pacheco Pond flow, in addition to the added tidal
18 prism created by the constructed tidal marsh, would not significantly change the
19 peak water-surface elevations between existing and future constructed
20 conditions. The changes that would occur are a small reduction (less than 0.25
21 feet) in peak stage when Pacheco Pond flow is diverted. While peak stages in
22 Novato Creek would not be substantially altered, certain portions of the sub-peak
23 stage (essentially lower portions of the tide cycle) would be lower with the
24 implementation of any of the alternatives.

25 Since the restoration alternatives would provide for a reduction in flood stage
26 within Novato Creek, albeit minimal, this impact is considered beneficial.

27 **Impact HYD-5: Potential Change in Drainage Capacity**
28 **from the Bel Marin Keys Lagoons**

29 BMK lagoons presently drain through the existing lock and culvert structures to
30 Novato Creek, when creek stage permits drainage. The lagoons also fill from
31 Novato Creek through these same structures. The BMK south lagoon can also
32 overflow through a culvert structure into the BMKV site. During high stage in
33 Novato Creek, the lagoons cannot be drained.

34 As part of the restoration design, some or all of the outlet flows from Pacheco
35 Pond would no longer discharge into Novato Creek in the wet season. This
36 modification would reduce sub-peak flood stage in Novato Creek during high
37 flow events and thus enhance the opportunity for lagoon drainage to Novato
38 Creek. As shown in figures 4-5 and 4-6, the diversion of outlet flow and the
39 addition of tidal prism have a negligible effect on peak stage (less than 0.25 feet)
40 in Novato Creek. However, certain portions of the sub-peak stage (lower

1 portions of the tidal cycle), would be lower with implementation of any of the 3
2 alternatives. The model results identified a 0- to 2-foot drop in some portions of
3 the sub-peak stage. It is during the sub-peak stage that the BMK lagoons could
4 be drained. By lowering sub-peak stage, the project would enhance the ability to
5 drain the lagoons between the higher portions of the tidal cycle.

6 In addition, Alternative 1 and Revised Alternative 2 include improving the
7 existing south lagoon overflow culverts and providing for this overflow into a
8 seasonal wetland/upland swale and improved drainage to Novato Creek.

9 A preliminary estimate of the amount of possible flow due to direct precipitation
10 in the southern portion of the BMK community (e.g south of Bel Marin Keys
11 Boulevard) including homes, streets and the lagoon was made. The area of the
12 BMK south lagoon and the homes and streets that drain to the lagoon is
13 approximately 242 acres. The estimated area of the swale in Revised Alternative
14 2 is about 387 acres. Based on the NOAA *Precipitation-Frequency Atlas of the*
15 *Western United States (NOAA 1973)*, the 100-year 24-hour precipitation for the
16 project area is 6 inches. For the swale area, south lagoon, and homes and streets
17 that drain to the south lagoon this corresponds to about 315 acre-feet. The new
18 overflow structures would be set at 1.5' NGVD to allow overflow into the
19 BMKV swale when the lagoon exceeds this elevation as required by the existing
20 BMK CSD easement. In Revised Alternative 2, the swale would have a capacity
21 of about 450 acre-feet (below 1.5' NGVD) to over a 1000 acre-feet (below 3.5'
22 NGVD), which could contain the flow noted above over several tidal cycles, until
23 the swale can fully drain. The maximum capacity of the swale would be higher
24 than cited here, as the swale could theoretically fill to the height of the lagoon
25 levee (5' NGVD), though this is unlikely. Estimates of ponding capacity for the
26 preferred alternative are included in a spreadsheet in appendix B.

27 Alternative 3 provides for new lagoon pumping facilities to drain the south
28 lagoon during periods of high lagoon stage.

29 Revised Alternative 2 includes improvements to the levees west of the existing
30 BMK south lagoon lock. These improvements would reduce the ability of high
31 stage in Novato Creek to flank the south lagoon lock, flow across Bel Marin
32 Keys Boulevard, and enter the south lagoon directly. By reducing the likelihood
33 of bypass flow, these improvements, in combination with the accomodation of
34 overflow into a swale on BMKV, in combination with the ability to discharge to
35 the BMKV swale (or to pump overflow in Alternative 3), the proposed project
36 would improve the ability to control stage in the lagoon itself.

37 None of the alternatives involve modifications to the normal lagoon operations,
38 such as flushing events, nor do they increase inflow into the lagoons during
39 normal or high stage flow. Therefore, the alternatives are not expected to result
40 in increased sedimentation of the lagoons themselves. The lagoons are filled
41 with tidal flow from Novato Creek and the Pacheco Pond outflow provides little
42 to the base flow of Novato Creek, except under storm conditions. Thus, the
43 redirection of some or all of the Pacheco Pond outflow during the wet season is

1 not expected to significantly effect the ability to flush the BMK lagoons. Since
2 the restoration alternatives would overall result in improvements to drainage
3 conditions from the BMK lagoons, this impact is considered beneficial.

4 **Impact HYD-6: Potential Increases in Tidal Flooding**

5 All of the restoration alternatives would breach and lower the outboard levee
6 between BMKV and the San Pablo Bay, thereby opening the eastern portion of
7 the site to tidal inundation and potential tidal flooding. Alternative 1 and Revised
8 Alternative 2 would also breach the Novato Creek/BMKV levee. All restoration
9 alternatives include an upland transition berm and levee structure that would be
10 constructed to an elevation above the 100-year tidal flood elevation, with an
11 allowance for settling. This outboard levee is designed to prevent direct tidal
12 intrusion into the western portion of the site, including the swale, upland,
13 seasonal wetland, and the expanded part of Pacheco Pond for tidal elevations
14 below the 100-year tide. Since this feature would not increase the potential for
15 tidal flooding and incorporates design features for new levees that would be
16 exposed to tidal flows, this impact is considered less than significant.

17 **Impact HYD-7: Potential Inconsistency with Flood Zoning**

18 Based on the hydrologic and hydraulic analysis conducted for the BMKV
19 expansion, the restoration alternatives are not expected to result in an adverse
20 physical effect on flooding related to Novato Creek, Pacheco Pond, or adjacent
21 properties, such as the BMK community.

22 The purpose of the F-1 zone is to protect life and property within the designated
23 zone and to prevent random, uncontrolled development from impeding passage
24 of floodwaters within the zone and increasing flooding. All of the restoration
25 alternatives include removal of the levee that separates the BMKV site from
26 Novato Creek, which would enhance passage of floodwaters from Novato Creek
27 to San Pablo Bay by increasing the width of the flood channel along the
28 perimeter of the BMKV site. None of the alternatives includes any filling or
29 placement of structures within the F-1 zone, and thus the project overall appears
30 to be consistent with the F-1 zoning requirements. However, MCFCWCD is the
31 responsible agency for determining the applicability and consistency of proposed
32 actions related to the county flood zoning ordinances, and a determination of
33 consistency with the F-1 zoning requirements has not been made by MCFCWCD
34 as of this final SEIR/EIS.

35 The F-2 zone covers the remainder of the BMKV site. The purpose of the F-2
36 zone is to protect life and property and prevent increased flooding caused by
37 random, uncontrolled development that would decrease the capacity of secondary
38 floodplains to receive overflow floodwaters. As described above, the wetland
39 restoration alternatives are protective of life and property, provide a net reduction

1 in localized flood risk around Pacheco Pond, do not result in an increase of flood
2 stage in Novato Creek, and do not impede passage of floodwaters.

3 The restoration alternatives include placement of fill in the form of dredged
4 material, levee construction, and natural sedimentation. The restoration
5 alternatives do not include any specific design features to replicate the ultimate
6 channel or its equivalent. However, as noted above, the restoration alternatives
7 are expected to lower relative stage in Pacheco Pond and are not expected to
8 cause an increase in stage in Novato Creek.

9 The project would not eliminate all ponding capacity on the site. It would
10 establish hydrologic connections to the remaining ponding capacity, so that
11 capacity would be as effective or more effective than existing ponding capacity,
12 in particular related to the projected lowering of Pacheco Pond peak stage, which
13 would not occur without the project. Though fill (in the form of levees) and tidal
14 inundation would lower the theoretical ponding capacity on the site, the change
15 in hydrologic connections makes the remaining ponding capacity more effective
16 by providing hydrologic connections that route flow onto the BMKV site at a far
17 lower stage than possible at present.

18 The preferred alternative, Revised Alternative 2, includes designs for hydrologic
19 connections from Pacheco Pond and the BMK south lagoon to retention areas on
20 the BMKV parcel. Based on a preliminary estimate, the 387-acre swale area
21 would have a ponding capacity of about 450 acre-feet at the overflow structure
22 invert elevation of 1.5' NGVD and a ponding capacity of over 1,000 acre-feet
23 when the water surface elevation in the swale reaches 3.5' NGVD (assuming
24 overflow structures are 24" culverts). The maximum capacity would depend on
25 the final design for the swale and the overflow structures, as it is possible for the
26 swale to fill to the adjacent levee design height of 5' NGVD. The expanded
27 Pacheco Pond/emergent marsh area would have a capacity of 175 acre-feet
28 (between 1.5' NGVD and 7' NGVD). The 136-acre seasonal wetland area
29 connected to the expanded Pacheco Pond would have a ponding capacity of
30 about 400 acre-feet below the 1.5' NGVD invert elevation of the overflow
31 structure and a capacity of about 650 acre-feet when the water surface elevation
32 in the seasonal wetland reached 3.5' NGVD (assuming the overflow structures
33 are 24" culverts). The maximum ponding capacity of the seasonal wetland will
34 depend on the final design for the seasonal wetland and the overflow structure.
35 Ponding estimates are included in a spreadsheet in appendix B.

36 The ponding capacity of the tidal marsh wetland adjacent to Novato Creek varies
37 with the tide and thus was not calculated. However, with the lowering of the
38 outboard levee along Novato Creek to around MHW (approximately 2.8 feet
39 NGVD), the tidal marsh restoration area could also receive overflow from the
40 creek across the lowered levee.

41 In high-flow events, what influences water surface elevations is the effective
42 routing of flow away from the primary floodway. As noted above, the proposed
43 project is not expected to increase peak water surface elevation in Novato Creek

1 and would actually lower sub-peak elevations during high-flow events, relative to
2 the existing setting. As a measure of effective ponding capacity, the proposed
3 project provides hydrologic connections that are at least equivalent to current
4 connections, and potentially improved for sub-peak conditions. Further, in
5 relation to Pacheco Pond, all alternatives provide an increase in overflow
6 capacity that would actually reduce peak stage.

7 Based on the results of the hydrologic and hydraulic studies to date, the Corps
8 and Conservancy consider that the proposed project would actually increase
9 effective ponding capacity and thus should be considered in compliance with the
10 flood zoning. However, MCFCWCD has yet to make this determination.

11 NEPA and CEQA require an evaluation of whether a physical effect is a
12 significant effect on the environment. The completed hydrologic and hydraulic
13 analysis has not identified an adverse physical effect on flooding. MCFCWCD
14 has not formally determined whether the restoration alternatives are consistent
15 with the requirements of the flood zoning ordinances. Pending that
16 determination and for the purposes of significance determination only, it is
17 assumed as of this draft SEIR/EIS that the restoration alternatives are not
18 consistent with the F-2 zoning requirements. The Corps and Conservancy, as the
19 CEQA and NEPA lead agencies, considered the conclusions of the completed
20 hydrologic and hydraulic analysis; the physical effects of filling, constructing
21 new levees, breaching/lowering the perimeter levees, diverting some or all of the
22 Pacheco Pond outlet flow; and the potential inconsistency with the F-2 zoning, in
23 addition to the intensity and context of this impact, prior to determining whether
24 a significant effect on the environment related to flooding may occur with
25 implementation of the BMKV expansion. After considering these factors, the
26 lead agencies determined that this is a less-than-significant effect on the
27 environment related to flooding because, although it may later be determined that
28 the project is inconsistent with the local flood zoning ordinance, the project is not
29 expected to result in an increased flood risk to people or property and is expected
30 to result in a minor decrease in flood stage around the perimeter of Pacheco
31 Pond.

32 In recognition of the concerns of the City of Novato, Marin County, and local
33 residents concerning the F-2 zoning (as well as the MCFCWCD easements)
34 relative to the site, the Conservancy, MCFCWCD, and the City of Novato have
35 developed an Agreement that establishes a process by which further hydrologic
36 and hydraulic studies will be developed, completed, and reviewed to examine the
37 potential effects of the proposed project on water surface elevations in Novato
38 Creek and other parts of the lower portion of the Novato Creek watershed.
39 Although the lead agencies believe that the further studies are beyond what is
40 necessary for impact assessment under NEPA and CEQA, the Conservancy as
41 the local sponsor of the project has agreed to conduct these additional studies that
42 the City and County believe are necessary to make determinations concerning the
43 consistency of the project with the F-2 zoning and MCFCWCD easements. The
44 lead agencies fully expect that these additional studies will confirm the results of
45 the studies to date and the conclusion in the SEIR/EIS that the proposed project

1 would not increase flooding, and thus do not believe these studies are necessary
2 for the completion of the NEPA and CEQA processes. The Agreement contains
3 performance standards that the additional studies must show the proposed project
4 to meet. These performance standards are that the proposed project must be
5 shown not to increase peak water elevations in Novato Creek, Arroyo San Jose,
6 Pacheco Creek, Pacheco Pond, Bel Marin Keys lagoons, or any other part of the
7 Novato Creek watershed. If the studies do not show this (which the project
8 sponsors think is highly unlikely), the Conservancy has agreed not to proceed
9 with construction of the project until flooding issues are resolved to the
10 satisfaction of the City of Novato and Marin County. The Agreement is included
11 in appendix I.

12 **Impact HYD-8: Potential Conflict with Existing Drainage** 13 **Agreements**

14 The areas of the 1980 and 1987 MCFCWCD drainage agreements would be
15 partially filled under Alternative 1 and Revised Alternative 2 by dredged fill and
16 natural sedimentation and by natural sedimentation under Alternative 3. As
17 noted above, Revised Alternative 2 contains a swale area with a ponding capacity
18 of 450 acre-feet (below the 1.5' NGVD elevation of the overflow invert) to more
19 than 1,000 acre-feet (when water fills to 3.5' NGVD or greater) connected to the
20 BMK south lagoon, an expanded pond area with capacity of 175 acre-feet, and a
21 seasonal wetland area connected to the expanded Pacheco Pond with a ponding
22 capacity of 400 to 650 acre-feet (up to 1.5' and 3.5' NGVD respectively). The
23 ponding capacity of the tidal marsh wetland adjacent to Novato Creek varies with
24 the tide and thus was not estimated. Based on the results of the hydrologic and
25 hydraulic studies to date, the Corps and Conservancy consider that the project
26 would actually increase effective ponding capacity, and thus should be
27 considered in compliance with the MCFCWCD easements. However,
28 MCFCWCD has yet to make this determination. This determination will be
29 made upon completion of the additional studies conducted as part of the MOA
30 mentioned above.

31 If it is determined by MCFCWCD that sufficient ponding capacity is retained to
32 replace that of the drainage agreements, the drainage agreements could be
33 amended to reflect the new ponding areas present with restoration. The
34 Conservancy is willing to work with MCFCWCD to record amended drainage
35 easements for the new ponding areas if MCFCWCD determines this is necessary
36 to comply with the easements.

37 Pending MCFCWCD determination and for the purposes of significance
38 determination only, it is assumed for the SEIR/EIS that the restoration
39 alternatives are not consistent with the MCFCWCD easements. The Corps and
40 Conservancy, as the CEQA and NEPA lead agencies, considered the conclusions
41 of the completed hydrologic and hydraulic analysis; the physical effects of
42 filling, constructing new levees, breaching/lowering the perimeter levees, and
43 diverting some or all of the Pacheco Pond outlet flow; and the potential

1 inconsistency with the easements, in addition to the intensity and context of this
2 impact, prior to determining whether a significant effect on the environment
3 related to flooding may occur with implementation of the BMKV expansion.
4 After considering these factors, the lead agencies determined that the BMKV
5 expansion would have a less-than-significant effect on the environment related to
6 flooding because, although it may later be determined that the project is
7 inconsistent with the easements, the project is not expected to result in an
8 increased flood risk to people or property and is expected to result in a minor
9 decrease in flood stage around the perimeter of Pacheco Pond.

10 The 1997 BMK CSD drainage agreement that allows for overflow from the BMK
11 south lagoon would be accommodated by overflow structures under Alternative 1
12 and Revised Alternative 2 leading to the swale area, and by a relief pump under
13 Alternative 3. As noted above, a conservative estimate of the 100-year 24 hour
14 precipitation amount for the south lagoon, the houses and streets that drain to the
15 south lagoon, and the BMKV swale (in Revised Alternative 2) is about 315 acre-
16 feet. Under Revised Alternative 2 the capacity of the swale below 1.5 feet
17 NGVD is estimated to be around 450 AF, which is adequate to hold the potential
18 flow until it can be discharged to Novato Creek on the low tide. The capacity of
19 the swale up to 3.5' NGVD would be over 1,000 AF. Alternative 1, similar to
20 Alternative 2, would also include a swale sized to accommodate overflow; while
21 the pump or pumps in Alternative 3 would be sized to handle sufficient overflow
22 to comply with the easement. Thus, the restoration alternative designs are
23 considered to be compliant with the requirements of the BMK CSD drainage
24 agreement, and this is considered a less-than-significant impact. The
25 Conservancy will continue to consult with the BMK CSD during the detailed
26 design phase concerning the new overflow structures to be built to deliver high-
27 stage flow from the lagoon to the new swale.

28 **Impact HYD-9: Potential Changes in Flood Zone Mapping** 29 **and Flood Insurance**

30 This impact discussion has been added since the Draft SEIR/EIS to address
31 concerns expressed in some of the comments that the proposed project may result
32 in flood zone changes that might result in a change in flood insurance rates for
33 adjacent residential areas and that the proposed project would affect the ability of
34 the local community to participate in the National Flood Insurance Program.

35 Because a portion of the site would be opened up to tidal action, the portion of
36 the BMKV site eastward of the new outboard levee would be remapped from an
37 A zone (riverine flooding) to a V zone (coastal flooding). However, the new
38 outboard levee would be designed to prevent tidal flooding from reaching the
39 remainder of the BMKV site, thus the current FIRM mapping of the remainder of
40 the site is likely to remain unchanged. All of the restoration alternatives would
41 change flood mapping zones on the BMKV site itself, but would not change
42 flood mapping of adjacent areas; the hydrologic and hydraulic studies conducted
43 as part of the conceptual design determined that the project would not result in an

1 increase in flood stage in adjacent water bodies or increased risk of flooding to
2 adjacent properties.

3 FEMA periodically updates the FIRM maps based on new FISs. New studies
4 utilize the latest data reflecting the physical conditions within a studied
5 community relevant to flooding. These new studies sometimes result in changes
6 in mapping of SFHAs. Based on the hydrologic and hydraulic studies to date, the
7 proposed BMKV expansion would not result in changes that would be the basis
8 for SFHA mapping changes, except those relevant to the tidal marsh restoration
9 area on the BMKV site itself.

10 The FIS studies are engineering studies that focus on the physical nature of
11 communities relevant to flooding. The 1986 FEMA FIS for the unincorporated
12 area of Marin County makes no mention of the F-2 zoning. In conversation with
13 several MCFCWCD staff members concerning the BMKV project, none has
14 identified any direct relationship between the F-2 zoning and FEMA FIRM
15 mapping or any mention of F-2 zoning in FEMA flood studies. As noted above,
16 a local community must adopt floodplain management regulations in order to
17 participate in the NFIP. The F-2 zoning is part of MCFCWCD floodplain
18 management regulations. As discussed above, the local flood zoning prohibits
19 fill in the F-2 zone if it would reduce the ponding capacity of a site by more than
20 25%. As described above, the hydrologic and hydraulic studies have
21 demonstrated that, although fill would be placed on the site, the restoration
22 alternatives would not result in a loss of ponding capacity that would result in an
23 increase in flood levels.

24 Based on the hydrologic and hydraulics study results, the proposed project is
25 considered consistent with FEMA floodplain management criteria.

26 The Conservancy, as the state lead agency and owner of the BMKV site, has
27 stated in the Agreement with the City of Novato and MCFCWCD that, in the
28 unlikely event that the confirmatory studies to be done under the Agreement
29 indicate that the project would increase peak flood levels above baseline in
30 Novato Creek, Pacheco Pond, the BMK lagoons, or any other part of the Novato
31 Creek watershed, it would not proceed with construction of the project until
32 flooding issues are resolved.

33 Since no project-related changes in offsite flood zoning mapping are expected,
34 flood insurance rates are not expected to be affected, nor is the ability of the local
35 community to participate in the NFIP. The change of flood zone mapping on the
36 site itself is not considered an adverse or significant effect on the environment.

37 **Impact TH-1: Modification to Circulation in San Pablo Bay**

38 Tidal fluctuations into and out of the restored tidal wetlands under Alternative 1,
39 Revised Alternative 2, and Alternative 3 would generate large tidal currents in
40 and around the perimeter levee breaches. The subtidal channels connecting the
41 basins to the Bay would convey flows of up to 3,000 cfs in areas where no tidal

1 currents exist today. The fluid momentum associated with these flows would be
2 rapidly dissipated along the mud flats as the channels discharge into San Pablo
3 Bay. However, because of the vast size and volume of San Pablo Bay, the
4 general effect of this momentum exchange away from the point of discharge
5 would be insignificant. Thus, large-scale circulation patterns in San Pablo Bay
6 would not be significantly affected by the restoration alternatives, and the impact
7 would be less than significant.

8 **Impact TH-2: Changes in Circulation and Morphologic** 9 **Evolution in Existing Tidal Wetlands**

10 For the tidal marshes to properly evolve, adequately sized connecting channels
11 would have to be maintained to provide full tidal exchange between the basins
12 and San Pablo Bay. Under-sized connecting channels would reduce the amount
13 of sediment-laden water reaching each basin by creating a hydraulic choke. This
14 could inhibit the morphologic evolution of the wetlands to such a degree that the
15 project objectives might not be achieved, and the loss of biological resources
16 might not be offset by the restoration alternatives. Therefore, this impact to
17 biological resources could be significant. For further discussion and proposed
18 mitigation, see the discussion under the *Biological Resources* section of this
19 chapter.

20 **Impact TH-3: Potential Changes in Lower Novato Creek** 21 **Morphology due to Diversion of Pacheco Pond Outlet** 22 **Flows**

23 The restoration alternatives would redirect some or all of the Pacheco Pond outlet
24 flows in the wet season from Novato Creek to the tidal wetlands and San Pablo
25 Bay through a flap-gated culvert (Alternatives 1 and 3), or to seasonal wetlands
26 on BMKV and then to San Pablo Bay (Revised Alternative 2). Daily tidal
27 excursions through Novato Creek are the dominant hydraulic control on the
28 present size and morphology of lower Novato Creek. Hydrologic and hydraulic
29 modeling of restoration alternatives indicate that stage and flow rate in Novato
30 Creek are primarily controlled by Novato Creek flows and San Pablo Bay tidal
31 stage. Pacheco Pond flows can contribute flows to Novato Creek during periods
32 that Novato Creek stage is lower than Pacheco Pond stage. These contributions,
33 however, are relatively minor compared to the higher frequency of occurrence
34 and magnitude of flows within the lower Novato Creek that result from tidally
35 driven flows during spring tide events. Extreme flow events in Novato Creek
36 may induce episodic changes in creek width and depth, although these changes
37 are relatively negligible with respect to the persistent energy imparted by tidal
38 flows. Since the morphology of the subtidal channel of lower Novato Creek is
39 primarily controlled by Novato Creek hydrology and tidal conditions within San
40 Pablo Bay, any small changes in lower Novato Creek morphology due to
41 diversion of some or all of the Pacheco Pond outlet flows are considered less than

1 significant. These changes, as discussed in *Land Use and Utilities* below, are not
2 expected to have a significant effect on the navigability of Novato Creek.

3 The project includes a Monitoring, Maintenance, and Adaptive Management Plan
4 (MAMP). The draft MAMP is included in appendix K. The MAMP includes
5 monitoring of the Novato Creek channel above and below the Pacheco Pond
6 existing outlet before and after diversion of wet season flow to the BMKV site.
7 Although adverse effects are not expected on morphology or navigation,
8 monitoring of the channel in the context of the MAMP offers a mechanism to
9 confirm the estimated effects on morphology. In the unlikely event that
10 monitoring identifies a project-related significant effect on morphology or
11 navigation, the MAMP also offers a mechanism to consider potential corrective
12 actions.

13 **Impact TH-4: Potential Changes in Pacheco Pond Outlet** 14 **Channel due to Diversion of Outlet Flow**

15 The restoration alternatives would redirect some or all of the flows from the
16 existing Pacheco Pond outlet in the wet season to Novato Creek to the tidal
17 wetlands and San Pablo Bay through a flap-gated culvert (Alternatives 1 and 3),
18 or to seasonal wetlands on BMKV through a weir and then to San Pablo Bay
19 through a flap-gated culvert (Revised Alternative 2). Depending on the amount
20 and timing of diversion of flows, it is possible that sedimentation may cause the
21 outlet channel between Bel Marin Keys Boulevard and Novato Creek to fill in.
22 The project includes development of a new water management plan, in
23 cooperation with MCFCWCD and DFG, to identify options for managing
24 Pacheco Pond wildlife habitat and flood control. The water management plan
25 should be developed in tandem with the engineering design of the restoration
26 project. Because the existing outlet would be used for any dry-season flow, it is
27 expected that the new plan would result in parameters for dual operation of the 2
28 future outlets from the pond (to Novato Creek and to BMKV) in the wet season.
29 The purpose of dual operation would be to maximize flood control and wildlife
30 habitat benefits, while maintaining some flow along the existing outlet channel to
31 Novato Creek to reduce sedimentation in the channel. It is possible that, for
32 flood control purposes during high-stage events in Novato Creek, it may be
33 determined best to close the existing outlet at Novato Creek and divert all flows
34 to the restoration site during the storm event. However, under non-storm events,
35 it may be determined feasible to operate both outlets. With implementation of a
36 new management plan, the impact to sedimentation in the channel is expected to
37 be less than significant. Potential effects on habitat due to diversion of the
38 existing Pacheco Pond outlet flow are discussed in the *Biological Resources*
39 section of this chapter.

1 **Impact TH-5: Outboard Marsh Shoreline Erosion**

2 Tidal circulation between the restored tidal marsh and San Pablo Bay is not
3 expected to induce or aggravate erosion of existing tidal marsh shoreline along
4 San Pablo Bay. However, the proposed BMKV expansion would involve
5 excavation of channels through the existing outboard marsh. Additional erosion
6 of the outboard marsh surface can be expected if the channels widen in response
7 to an increase in tidal exchange. The loss of existing tidal marsh is considered a
8 less-than-significant impact because a primary purpose of the alternatives is the
9 creation of new and additional tidal marsh habitat. The proposed BMKV
10 expansion is designed to create tidal marsh habitat over and above the amount
11 lost by excavation and erosion of the connecting outboard channels.

12 **Impact TH-6: Excessive or Unexpected Erosion of**
13 **Perimeter Levees**

14 Perimeter levees adjacent to restoration basins could be subject to increased
15 erosion from current and wave forces. Tidally driven circulation and currents are
16 expected to develop in the basins due to tidal fluctuations, although the velocities
17 are not expected to be high enough to pose a significant erosion risk to adjacent
18 levee structures. Final design studies will be undertaken to investigate and
19 quantify tidal currents in each marsh basin to better assess the risks of localized
20 erosion.

21 Wind-generated waves pose a more significant erosion risk on perimeter levees
22 than tidal currents. The size of wind-generated waves is primarily a function of
23 the wind speed, wind fetch, wind duration, and water depth. Erosion from wind-
24 generated waves can be minimized or eliminated by the use of appropriate levee
25 materials, levee geometric design, and wave dissipation structures, and by
26 reducing wind fetch and therefore the opportunity for wind waves to develop.
27 The alternative designs presented in the conceptual plan (see figure 3-12 in
28 chapter 3) utilize a combination of levee berms for providing wave dissipation
29 and erosion protection, and internal peninsulas for reducing wave fetch and
30 resulting wave heights.

31 Additional geotechnical and engineering studies will be conducted as the part of
32 final design. The final design will include properly sized levees, levee erosion-
33 protection measures, and internal peninsulas to prevent any significant impacts
34 caused by levee erosion. Therefore, the impact of perimeter levee erosion is
35 considered less than significant.

36 The potential exposure of levees to tsunamis or seiches is discussed in the
37 *Geology, Soils, and Seismicity* section of this chapter.

Impacts and Mitigation Measures Common to Alternative 1 and Revised Alternative 2

Impact TH-7: Modification to Sedimentation Processes and Morphology in San Pablo Bay

The marsh plains in the BMKV tidal basins would accrete naturally by capturing sediments transported into the basins through tidal exchange. The sediment would consist mainly of bay muds resuspended by wave and wind activity and fine suspended sediment carried from upland sources by drainages emptying into San Pablo Bay, including Novato Creek. The capture of sediment in the basins would result in lower local sediment concentrations in the Bay, which could affect local sedimentation and morphological processes.

The conceptual design plans for Alternative 1 and Revised Alternative 2 include perimeter levee breaches and connecting channels along the San Pablo Bay shoreline and at the mouth of Novato Creek. Both alternatives call for the importation and placement of dredged material during the construction phase, which would significantly reduce the resultant tidal prism volume of each basin after breaching. Preliminary calculations of the sediment loading required to sustain maximum accretion rates in the basins range between 0.08 and 0.23 million tons of Bay sediments per year (assuming a bulk density of 1.3 grams per cubic centimeter) for the first 10 years. This is equivalent to only about 2–7% of the total estimated sediment inflow into San Pablo Bay from the Sacramento and San Joaquin Rivers combined (3.4 million tons per year). The sediment requirements of the basins for Alternative 1 and Revised Alternative 2 would also be relatively ephemeral and would be reduced to less than 1% after 20 years. The effect of sediment capture on the sedimentation processes and morphology of San Pablo Bay is thus considered a less-than-significant impact.

Impact TH-8: Modifications to Sedimentation Processes and Morphology of Novato Creek due to Breach of BMKV/Novato Creek Levee

The conceptual design plans for Alternative 1 and Revised Alternative 2 include a marsh basin connection to Novato Creek through a single levee breach. The breach would be located at the downstream end of the creek, only a few thousand feet from San Pablo Bay. Preliminary analysis of local scour from increased tidal prism reveals likely channel widening of between 10 and 40 feet along the portion of Novato Creek from the breach to the mouth, a distance of approximately 4,000 feet (see figure 4-7). The estimated change in depth is an increase of approximately 0.5 to 1.0 feet. These changes would be expected to occur along the existing main channel. Due to the short length of this corridor, it is estimated that only between 2 and 5 acres of tidal marsh floodplain along the creek channel would be lost to erosion. This impact is considered a less-than-

1 significant impact on habitat because a primary purpose of the alternatives is the
2 creation of new and additional marsh habitat, and the amount lost to erosion
3 along Novato Creek would be more than compensated for by the habitat created
4 by implementing the alternatives. See discussion of navigability below.

5 In addition to main channel widening, the subtidal channel beyond the mouth of
6 Novato Creek to the Petaluma channel (a distance of approximately 2000 feet
7 between Marker 25 and Marker 7) would also be subject to an increased tidal
8 flow due to an increase in tidal prism. It is expected that 10 to 15 acres of
9 existing mudflat along the subtidal channel would be eroded into mudflat channel
10 because of the increased tidal prism from the upstream marsh basin connection
11 (see figure 4-7). However, the loss of 10 to 15 acres of existing mudflat
12 represents a small fraction of the total existing fringe mudflat along San Pablo
13 Bay, and the proposed BMKV expansion is expected to create more than 50 acres
14 of new mudflat habitat. This is considered a less than significant impact on
15 habitat. See discussion of navigability below.

16 Regarding short-term sedimentation immediately after the breach of the Novato
17 Creek levee, the potential exists for limited amounts of unconsolidated material
18 to be mobilized from the project site during ebb tides. This potential increase in
19 transport of colloidal particles would weakly increase the suspended sediment
20 effluent concentration from the site on ebb tides immediately following the
21 breach of the Novato Creek levee. The plume of slightly elevated suspended
22 sediment would quickly dissipate through advection (flow in the creek) and
23 dispersion in the Bay. Suspended sediment concentrations entering the creek on
24 flood tides would be at or near ambient Bay suspended sediment concentrations.
25 Increased tidal flow would produce a net increase in tidal scour that would more
26 than offset the temporary increase of suspension of sediments. Ebb-tide
27 suspended sediment concentrations from the project site would decrease below
28 ambient Bay suspended sediment concentrations following the breach as the site
29 materials consolidate and the site reverts to a net sediment sink.

30 Regarding long-term sedimentation, the tidal basin itself is attached to the
31 Novato Creek breach and is designed as a sediment trap in order to capture
32 natural sediment to form the final cover for the restored wetland area. Thus,
33 during formation of final marsh elevations after breach (a process that would take
34 approximately 10-20 years), the site would actually capture a portion of the
35 sediment from Novato Creek and San Pablo Bay flows. The functioning of the
36 site as a sediment trap until marsh plain equilibrium is reached and the increase
37 in tidal flows below the breach would result in a net erosional effect in the creek
38 channel, as noted above. No long-term increase in sedimentation is expected.

39 Regarding navigation, these changes in morphology of the lower portion of
40 Novato Creek are expected to occur directly adjacent to the existing main
41 channel of Novato Creek from the breach to the mouth, and in the tidal mudflat
42 north and south of the subtidal channel from the mouth (Marker 25) to the
43 Marker 7 (see figure 4-7). The addition of tidal prism volume from the marsh
44 basin is expected to increase the width and equilibrium depth of Novato Creek.

1 However, these changes will occur only on the reach downstream of the breach
2 and should not affect the upstream hydraulics of the creek. It is also important to
3 note that these changes are not expected to have a significant adverse effect on
4 the navigability of Novato Creek. In addition to the downstream reach of Novato
5 Creek, the tidal mudflat along the subtidal channel would erode by between 10 to
6 15 acres. This erosion will likely occur along the sides of the subtidal channel,
7 but may also occur along the channel invert.

8 Since this downstream reach of Novato Creek presently requires maintenance
9 dredging to provide adequate channel size for boat passage, the addition of tidal
10 prism is an incidental beneficial effect of the project on navigability of Novato
11 Creek, although the authorized purpose of this project is not navigation. It
12 should be noted that the project's potential addition of 400 to 600 acres of tidal
13 prism (depending on the alternative chosen) to this portion of Novato Creek is
14 not expected to result in sufficient channel width or depth to eliminate the need
15 for future maintenance dredging.

16 As noted in chapter 3, the project includes a Monitoring and Adaptive
17 Management Plan (MAMP). The draft MAMP is included in appendix K. The
18 MAMP includes monitoring of the Novato Creek channel above and below the
19 proposed Novato Creek breach before and after the breach is excavated.
20 Although adverse effects on navigation are not expected, monitoring of the
21 channel in the context of the MAMP offers a mechanism to confirm the
22 estimated effects on morphology. In the unlikely event that monitoring identifies
23 a project-related significant effect on morphology or navigation, the MAMP also
24 offers a mechanism to consider potential corrective actions.

25 **Impact TH-9: Potential Increase in Existing Levee Erosion** 26 **on Novato Creek**

27 Both Alternative 1 and Revised Alternative 2 propose breaching and lowering the
28 levee that separates Novato Creek from the BMKV site. The levee breach would
29 increase existing peak tidal flows in lower Novato Creek from 1500 cfs to
30 between 3000 and 5000 cfs. Local peak velocities downstream of the breach
31 would increase from 2 feet per second to 4 to 6 feet per second in some sections
32 during peak ebb tidal flow. This would result in localized widening (10 to 40
33 feet) and deepening (0.5 to 1.0 feet) of the existing subtidal Novato Creek
34 channel from the location of the levee breach to the mouth of Novato Creek.
35 However, the velocity increases and associated channel erosion would be limited
36 to the main creek channel. Since the perimeter levees are set back from the main
37 channel and are built on an elevated floodplain, the velocity increases near the
38 levees would be negligible. Therefore, the shear stresses on the existing Novato
39 Creek levees would not be significantly higher, and the impact would be
40 considered less than significant.

Impact TH-10: Modification to Circulation in Novato Creek

The hydraulic model predicted a peak tidal flow increase from an existing 1,500 cfs to about 3,000 to 5,000 cfs with the breach in place in Novato Creek. Existing peak tidal velocities of 2 feet per second would increase to between 4 and 6 feet per second in some sections. While flows would be amplified compared to the present conditions, the addition of tidal flow is not expected to change circulation patterns within the creek itself or downstream in San Pablo Bay. Because the increase of tidal flow would only amplify existing tidal flows but would not change circulation patterns, this is not considered a significant impact.

Impacts and Mitigation Measures Unique To Alternative 3

Impact TH-11: Modification to Sedimentation Processes in San Pablo Bay

The Alternative 3 design relies on tidal exchange and natural accretion processes to develop marsh plains rather than direct placement of dredged material to accelerate development of tidal marsh conditions. For this reason, the combined tidal prism volume of the Alternative 3 basins would be substantially larger during the initial years of the projects, and the rate of sediment transport into the basins would be greater. Preliminary calculations of the sediment loading required to sustain maximum accretion rates in the basins range between 0.8 and 1.2 million tons of material per year for the first 10 years. This is equivalent to about 25–34% of the estimated average sediment inflow into San Pablo Bay from the Sacramento and San Joaquin Rivers combined. This impact is far more substantial than the impacts associated with Alternative 1 and Revised Alternative 2, and is considered significant. To mitigate this impact, the Conservancy or successors in interest shall implement Mitigation Measure TH-1.

Mitigation Measure TH-1: Perform an Assessment of Modifications to Sedimentation Processes in San Pablo Bay for Alternative 3 and Implement Phased Tidal Basin Development, if Necessary.

The volume of sediment captured each year by the design plan outlined in Alternative 3 could be reduced in half by phased development of the 2 basins. Opening only a single basin during the initial phase of the proposed BMKV expansion would reduce the maximum catch rate to about 0.55 million tons per year. This is equivalent to about 16% of the total estimated sediment inflow into San Pablo Bay from the Delta. After approximately 25 to 30 years, this value would drop to less than 3%. Once the capture rate of the first basin is no longer significant, the 2nd basin would be opened to tidal action.

1 Water Quality

2 Affected Environment

3 Data Sources

4 The evaluation of water quality effects is based on information presented in the
5 following documents.

30 Board (Sequoia Analytical 2001)

Regulatory Setting

Federal Plans, Programs, and Policies

Clean Water Act

The EPA has granted the State of California primacy in administering and enforcing the provisions of the Clean Water Act (CWA) and NPDES. NPDES is the primary federal program that regulates point-source and nonpoint-source discharges to waters of the United States.

The State of California adopts water quality standards to protect beneficial uses of state waters as required by Section 303 of the CWA and the Porter–Cologne Water Quality Control Act of 1969 (PCWQCA).

Placement of clean fill materials into waters of the United States is regulated by Section 404 of the CWA, which is administered by the Corps. Under the CWA, the state RWQCB must issue Section 401 Water Quality Certification or a waiver for a project¹ to be permitted under Section 404. Water quality certification requires the evaluation of water quality considerations associated with dredging or placement of fill materials into waters of the United States.

State Plans, Programs, and Policies

The McAteer–Petris Act of 1965

The McAteer–Petris Act, enacted on September 17, 1965, established the San Francisco Bay Conservation and Development Commission (BCDC) as a temporary state agency charged with preparing a plan for the long-term use of the Bay (Bay Plan). In August 1969, the McAteer–Petris Act was amended to make BCDC a permanent agency and to incorporate the policies of the Bay Plan into state law.

Any person or governmental agency wishing to place fill, extract materials, or make any substantial change in use of any water, land, or structure within the area of BCDC’s jurisdiction must secure a permit from BCDC. Upon receiving an application for a permit, BCDC will transmit a copy of the application to the San Francisco Bay RWQCB. Within 30 days, the RWQCB must file a report with the commission that indicates the effect of the proposed project on water quality within the Bay. The main dredging policies that govern BCDC are listed below.

- Policy 1: Dredging and dredged material disposal should be conducted in an environmentally and economically sound manner.

¹ The term *project* used in this SEIR/EIS refers explicitly to the term as defined under CEQ’s regulations for NEPA and the State CEQA Guidelines: “the entirety of an action which has a potential for resulting in a physical change in the environment.” The Corps defines *project* as “an action that has been authorized by Congress,” such as the HWRP. The BMKV expansion has not been authorized by Congress.

- 1 ■ Policy 2: Dredging should be authorized when the Commission can find:
- 2 a. the applicant has demonstrated that the dredging is needed to serve a
- 3 water-oriented use or other important public purpose, such as
- 4 navigational safety;
- 5 b. the materials to be dredged meet the water quality requirements of the
- 6 San Francisco Bay Regional Water Quality Control Board;
- 7 c. important fisheries and Bay natural resources would be protected through
- 8 seasonal restrictions established by the California Department of Fish
- 9 and Game, the U.S. Fish and Wildlife Service and/or the National Marine
- 10 Fisheries Service, or through other appropriate measures;
- 11 d. the siting and design of the project will result in the minimum dredging
- 12 volume necessary for the project; and
- 13 e. the materials would be disposed of in accordance with Policy 3.
- 14 ■ Policy 3: Dredged materials should, if feasible, be reused or disposed
- 15 outside the Commission's Bay and certain waterway jurisdictions. Except
- 16 when reused in an approved fill project, dredged material should not be
- 17 disposed in the Commission's Bay and certain waterway jurisdiction unless
- 18 disposal outside these areas is infeasible and the Commission finds:
- 19 a. the volume to be disposed is consistent with applicable dredger disposal
- 20 allocations and disposal site limits adopted by the Commission by
- 21 regulation;
- 22 b. disposal would be at a site designated by the Commission;
- 23 c. the quality of the material disposed of is consistent with the advice of the
- 24 San Francisco Bay Regional Water Quality Control Board and the inter-
- 25 agency Dredged Material Management Office (DMMO); and
- 26 d. the period of disposal is consistent with the advice of the California
- 27 Department of Fish and Game, the U.S. Fish and Wildlife Service and
- 28 the National Marine Fisheries Service.
- 29 ■ Policy 4: If an applicant proposes to dispose dredged material in tidal areas
- 30 of the Bay and certain waterways that exceeds either disposal site limits or
- 31 any disposal allocation that the Commission has adopted by regulation, the
- 32 applicant must demonstrate that the potential for adverse environmental
- 33 impact is insignificant and that non-tidal and ocean disposal is infeasible...or
- 34 because the cost of disposal at alternate sites is prohibitive. In making its
- 35 decision whether to authorize such in-Bay disposal, the Commission should
- 36 confer with the LTMS agencies and consider the factors listed in Policy 1.
- 37 ■ Policy 5: To ensure adequate capacity for necessary Bay dredging projects
- 38 and to protect Bay natural resources, acceptable non-tidal disposal sites
- 39 should be secured and the Deep Ocean Disposal Site should be maintained.
- 40 Further, dredging projects should maximize use of dredged material as a
- 41 resource consistent with protecting and enhancing Bay natural resources,
- 42 such as creating, enhancing, or restoring tidal and managed wetlands,

- 1 creating and maintaining levees and dikes, providing cover and sealing
2 material for sanitary landfills, and filling at approved construction sites.
- 3 ■ Policy 11: A project that uses dredged material to create, restore, or enhance
4 Bay natural resources should be approved only if:
- 5 1. The Commission...determines all of the following:
- 6 a. the project would provide, in relationship to the project size,
7 substantial net improvement in habitat for Bay species;
- 8 b. no feasible alternatives to the fill exist to achieve the project purpose
9 with fewer adverse impacts to Bay resources;
- 10 c. the amount of dredged material to be used would be the minimum
11 amount necessary to achieve the purpose of the project;
- 12 d. beneficial uses and water quality of the Bay would be protected; and
- 13 e. there is a high probability that the project would be successful and
14 not result in unmitigated environmental harm;
- 15 2. The project includes an adequate monitoring and management plan and
16 has been carefully planned, and the Commission has established
17 measurable performance objectives and controls that would help ensure
18 the success and permanence of the project, and an agency or organization
19 with fish and wildlife management expertise has expressed to the
20 Commission its intention to manage and operate the site for habitat
21 enhancement or restoration purposes for the life of the project;
- 22 3. The project is either a small pilot project or the success of similar
23 projects has been demonstrated in similar settings;
- 24 4. The project would use only clean material suitable for aquatic disposal
25 and the Commission has solicited the advice of the San Francisco Bay
26 Regional Water Quality Control Board, the Dredged Material
27 Management Office and other appropriate agencies on the suitability of
28 the dredged material;
- 29 5. The project would not result in a net loss of bay surface area or volume.
30 Any offsetting fill removal would be at or near as feasible to the habitat
31 fill site;
- 32 6. Dredged material would not be placed in areas with particularly high or
33 rare existing natural resource values, such as eelgrass beds and tidal
34 marsh and mudflats, unless the material would be needed to protect or
35 enhance the habitat. The habitat project would not, by itself or
36 cumulatively with other projects, significantly decrease the overall
37 amount of any particular habitat within the Suisun, North, South, or
38 Central Bays, excluding areas that have been recently dredged;
- 39 7. After a reasonable period of monitoring, either:
- 40 a. the project has not met its goals and measurable objectives, and attempts
41 at remediation have proven unsuccessful, or

1 b. the dredged material is found to have substantial adverse impacts on
2 the natural resources of the Bay, then the dredged material would be
3 removed, unless it is demonstrated by competent environmental
4 studies that removing the material would have a greater adverse
5 effect on the Bay than allowing it to remain, and the site would be
6 returned to the conditions existing immediately preceding placement
7 of the dredged material if; and

8 8. The Commission has consulted with the California Department of Fish
9 and Game, the National Marine Fisheries Service, and the U.S. Fish and
10 Wildlife Service to ensure that at least one of these agencies supports the
11 proposed project.

12 BCDC must take action on a permit application, either denying or granting the
13 permit, within 90 days after a complete application is filed. The permit will be
14 automatically granted if BCDC fails to take specific action within that time
15 period. A permit will be granted for a project if BCDC finds and declares that
16 the project is either (1) necessary to the health, safety, or welfare of the public in
17 the entire Bay Area; or (2) of such a nature that it will be consistent with the
18 provisions of this title and the provisions of the San Francisco Bay Plan then in
19 effect.

20 **The Porter–Cologne Water Quality Control Act of 1969**

21 The PCWQCA established the State Water Resources Control Board (SWRCB)
22 and divided the state into 9 regional basins, each with a regional RWQCB. The
23 SWRCB is the primary state agency responsible for protecting the quality of the
24 State’s surface and groundwater supplies.

25 The PCWQCA authorizes the SWRCB to draft state policies regarding water
26 quality. In addition, the PCWQCA authorizes the SWRCB to issue Waste
27 Discharge Requirements (WDRs) for discharges into state waters. The
28 PCWQCA requires that the SWRCB or the RWQCB adopt water quality control
29 plans (Basin Plans) for the protection of water quality. A Basin Plan must:

- 30 ■ identify beneficial uses of water to be protected,
31 ■ establish water quality objectives for the reasonable protection of the
32 beneficial uses, and
33 ■ establish a program of implementation for achieving the water quality
34 objectives.

35 The Basin Plans also provide the technical basis for determining WDRs, taking
36 enforcement actions, and evaluating clean water grant proposals. The RWQCB
37 adopted the most recent Basin Plan in May 1995. The San Francisco Bay
38 RWQCB has jurisdiction over the expansion area.

1 **Policy for Implementation of Toxics Standards for Inland Surface**
2 **Waters, Enclosed Bays, and Estuaries of California**

3 The Enclosed Bays and Estuaries Plan (EBEP) (California State Water Resources
4 Control Board 1990) set forth new objectives for the protection of aquatic life
5 and human health. The water quality objectives in this plan were developed to
6 apply statewide, and they apply to all estuarine waters in the project region. The
7 plan contains objectives for regulating priority toxic pollutants, as listed under
8 the CWA. The EBEP was the subject of a lawsuit brought against the SWRCB,
9 alleging that the plan violated provisions of the Porter–Cologne Water Quality
10 Act and CEQA. On October 15, 1993, a tentative decision was issued that
11 overturned the plan and left the state technically without enforceable numerical
12 objectives for those toxic pollutants regulated in the plan.

13 After rescission of the plan, the SWRCB and the EPA agreed to pursue a
14 collaborative approach to reestablish the regulatory framework of the EBEP to
15 bring California into compliance with the CWA. The Policy for Implementation
16 of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of
17 California is the result of this effort. This State Policy for Water Quality Control,
18 adopted by the SWRCB on March 2, 2000 and effective by May 22, 2000,
19 applies to discharges of toxic pollutants into the inland surface waters, enclosed
20 bays, and estuaries of California subject to regulation under the State’s Porter–
21 Cologne Water Quality Control Act (Division 7 of the Water Code) and the
22 federal CWA. Such regulation may occur through the issuance of NPDES
23 permits, the issuance or waiver of WDRs, or other relevant regulatory
24 approaches.

25 The goal of this policy is to establish a standardized approach for permitting
26 discharges of toxic pollutants to non-ocean surface waters in a manner that
27 promotes statewide consistency. As such, this policy is a tool to be used in
28 conjunction with watershed management approaches and, where appropriate, the
29 development of Total Maximum Daily Loads (TMDLs) to ensure achievement of
30 water quality standards (i.e., water quality criteria or objectives, and the
31 beneficial uses they are intended to protect, as well as the State and federal
32 antidegradation policies).

33 This Policy establishes implementation provisions for priority pollutant criteria
34 promulgated by the USEPA through the National Toxics Rule and through the
35 California Toxics Rule (CTR), and for priority pollutant objectives established by
36 the RWQCB in its Basin Plan. The CTR was promulgated in May 2000, and the
37 RWQCB is currently preparing amendments to the Basin Plan to incorporate the
38 CTR water quality criteria. The CTR promulgated (1) ambient aquatic life
39 criteria for 23 priority toxics, (2) ambient human health criteria for 57 priority
40 toxics, and (3) a compliance schedule provision that authorizes the state to issue
41 schedules of compliance for new or revised NPDES permit limits based on the
42 federal criteria when certain conditions are met. The state must use these criteria
43 together with the state’s existing water quality standards when controlling
44 pollution in inland waters and enclosed bays and estuaries.

1 **California Regional Water Quality Control Board—San Francisco**
2 **Bay Region**

3 Water quality in streams and aquifers of the region is guided and regulated by the
4 California RWQCB, San Francisco Bay Region. The RWQCB has primary
5 authority for ensuring that water resources are protected from degradation by
6 pollutant discharges. The State Policy for Water Quality Control aims to achieve
7 the highest water quality consistent with the maximum benefit to the people of
8 the state.

9 To develop water quality standards that are consistent with the uses of a water
10 body, the RWQCB attempts to classify historical, present, and future beneficial
11 uses as part of the Basin Plan. Beneficial uses of the major rivers and
12 groundwater basins, along with narrative and numerical water quality objectives,
13 are established in the Basin Plan for the region (San Francisco Regional Water
14 Quality Control Board 1995). The Basin Plan is periodically reviewed and
15 updated pursuant to PCWQCA.

16 The USEPA has also promulgated freshwater and saltwater criteria for 126
17 priority pollutants (13 heavy metals, asbestos, and 112 organic compounds) in
18 the National Toxics Rule. The State of California is currently developing the
19 California Toxics Rule, which would promulgate new water quality criteria for
20 the priority pollutants and supersede the National Toxics Rule in California.

21 The RWQCB is required to identify water bodies that do not meet water quality
22 objectives pursuant to Section 303(d) of the CWA. Beneficial uses of surface
23 water in the expansion area include municipal and domestic supply; agricultural
24 supply; industrial service supply; groundwater recharge; contact and non-contact
25 recreation; warm, freshwater habitat; cold, freshwater habitat; wildlife habitat;
26 migration of aquatic organisms; and spawning, reproduction, and or early
27 development. Beneficial uses of groundwater throughout the region include
28 municipal and domestic supply, agricultural supply, and industrial service supply.

29 The Basin Plan has adopted the following objectives, which may apply to the
30 proposed wetland restoration, to protect water resources.

- 31 ■ Waters shall not contain biostimulatory substances in concentrations that
32 promote aquatic growths to the extent that such growth causes nuisance or
33 adversely affects beneficial uses.
- 34 ■ Waters shall not contain chemical constituents in concentrations that
35 adversely affect beneficial uses.
- 36 ■ Waters shall be free of discoloration that causes nuisance or adversely affects
37 beneficial uses.
- 38 ■ No pesticide or combination of pesticides shall be present in concentrations
39 that adversely affect beneficial uses.
- 40 ■ Discharges shall not result in pesticide concentrations in bottom sediment or
41 aquatic life that adversely affects beneficial uses.

- 1 ■ Persistent chlorinated hydrocarbon pesticides shall not be detectable in water
2 within the accuracy of the analytical methods approved by the USEPA.
- 3 ■ The suspended sediment load and suspended sediment discharge rate of
4 surface waters shall not be altered in such a manner as to cause nuisance or
5 adversely affect beneficial uses.
- 6 ■ Waters shall not contain suspended materials in concentrations that cause
7 nuisance or adversely affect beneficial uses.
- 8 ■ Groundwater shall not contain chemical constituents in concentrations that
9 adversely affect beneficial uses.

10 The Basin Plan also restricts increases in water temperature and reduction of
11 dissolved oxygen concentrations, especially in water bodies supporting cold-
12 water aquatic organisms.

13 **Discharge of Waste to Land Regulations**

14 The disposal of dredged material to land is regulated by the California Code of
15 Regulations (CCR), Title 23, Division 3, Chapter 15, *Discharge of Waste to Land*
16 *Regulations*, and is under the authority of the San Francisco RWQCB. Disposal
17 of dredged material to augment existing levees or create upland habitat is
18 considered upland disposal, and project approval by the San Francisco RWQCB
19 would be based on the concentration of constituents of concern in the dredged
20 sediment and site-specific conditions.

21 **Aquatic Disposal of Waste Regulations**

22 Wetland creation using dredged material is considered aquatic disposal under
23 Section 404 of the CWA and is regulated by the California SWRCB and the San
24 Francisco RWQCB under Section 401 of the CWA. The San Francisco RWQCB
25 is responsible for ensuring that water quality objectives in the Basin Plan are not
26 exceeded by a dredged material disposal project. The WDRs issued by the San
27 Francisco RWQCB could require that discharge from a project comply with
28 screening criteria and testing guidelines for wetland creation and upland
29 beneficial reuse to ensure that disposal does not result in degradation of the
30 existing site.

31 **Waste Discharge Requirements**

32 The San Francisco RWQCB establishes WDRs to protect those beneficial uses
33 identified in the Basin Plan. Beneficial uses protected by the Basin Plan that
34 would be applicable to the proposed wetland restoration include wildlife and fish
35 habitat, estuarine habitat, and preservation of rare and endangered species. In
36 establishing WDRs, the San Francisco RWQCB considers the potential impact
37 on beneficial uses within the area of influence of a discharge and the existing
38 quality of receiving waters based on the appropriate water quality objectives.

39 WDRs issued for a project based on water quality objectives may contain more-
40 or less-restrictive conditions that take into account factors such as economic
41 considerations in addition to actual and potential beneficial uses. Because San
42 Pablo Bay is considered a “water quality limited segment” in the Basin Plan,

1 more stringent water quality objectives and treatment levels could be required for
2 any discharge to this area. WDRs typically address turbidity, suspended solids,
3 and other water quality issues.

4 **NPDES Storm Water Discharge Permits**

5 In 1992, the SWRCB adopted a General Construction Storm Water Discharge
6 Permit, which requires land owners to file a Notice of Intent to discharge
7 stormwater runoff to waters of the U.S., from land disturbances greater than 5
8 acres. The permit was reissued in 1999 and modifications made in 2001. The
9 permit generally requires dischargers to eliminate non-stormwater discharges to
10 stormwater systems, develop and implement a stormwater pollution prevention
11 plan, and perform inspections of stormwater pollution prevention measures.

12 **Streambed Alteration Agreement**

13 A Streambed Alteration Agreement (DFG Code 1600 et. seq.) will be required
14 for any work within a creek or stream and its floodplain. Streambed Alteration
15 Agreements, commonly called 1603 Permits, may impose conditions to protect
16 water quality during construction.

17 **Regional Water Quality Conditions**

18 San Pablo Bay is the receiving water for all drainage from the expansion site,
19 including Novato Creek and Pacheco Pond. The Bay receives substantial inflow
20 from the Sacramento and San Joaquin Rivers and smaller amounts of inflow from
21 the Petaluma and Napa Rivers and Sonoma and Novato Creeks. Water quality is
22 maintained by circulation and flushing as a result of tidal action and freshwater
23 inflow. Water quality and salinity in the Bay are determined by the relative mix
24 of these water sources.

25 In a natural system, surface-water quality depends primarily on the mineral
26 composition of the rocks in the upper source areas of the stream. Farther
27 downstream, the water quality is influenced by the mineral characteristics of the
28 materials through which it flows and by contributions from tributaries. In an
29 urban or developed system such as San Francisco Bay, water quality is also
30 affected by discharges from point and nonpoint sources.

31 Water quality in San Pablo Bay has been evaluated as part of a study of San
32 Francisco Bay (Aquatic Habitat Institute 1990). Data from the Aquatic Habitat
33 Institute study indicate that levels of some pollutants may be lower than indicated
34 by previous data. However, several pollutants are still present at levels of
35 concern in San Pablo Bay and San Francisco Bay as a whole. Table 4-4 lists
36 waters in the San Pablo Bay region that have been designated as impaired under
37 Section 303(d) of the Clean Water Act and the pollutants for which they were so
38 designated. The designation as impaired can be the result of pollutants, such as
39 heavy metals or pesticides, or a physical property of the water, such as dissolved
40 oxygen or temperature.

1 The SWRCB is currently revising the 303(d) impaired water body list and plans
2 to release its draft final list on October 15, 2002. In addition to a revision of the
3 formal list, SWRCB is proposing to create a “watch list” for potentially impaired
4 water bodies. Novato Creek is proposed for inclusion on the watch list for
5 sedimentation and siltation concerns. The watch list is intended for RWQCB-
6 identified waters where minimal, contradictory, or anecdotal information
7 suggests standards are not met but either (1) the available data or information are
8 inadequate to draw a conclusion, or (2) a regulatory program is in place to
9 control the pollutant but data are not available to demonstrate that the program is
10 successful. In many cases, the data or information is not of adequate quality and
11 quantity to support a listing under Section 303(d). In these cases, a finding is
12 warranted that water quality appears impacted and more information must be
13 collected to resolve whether standards and beneficial uses are attained.
14 Placement of Novato Creek on this watch list is not a formal designation but
15 requires SWRCB to consider listing the creek in relation to sedimentation and
16 siltation (State Water Resources Control Board 2002).

17 The water quality in the San Pablo Bay tributaries is influenced by past and
18 present agricultural activities. Sonoma Creek and the Petaluma and Napa Rivers
19 are impaired by sediment, nutrients, and pathogens that are all related to the
20 abundant agricultural activities found in their watershed. The North Bay and San
21 Pablo Bay are also impaired by persistent agricultural chemicals, such as DDT
22 and Chlordane, which may have been used anywhere in the Sacramento and San
23 Joaquin Rivers watersheds. These areas are also impaired by metals and PCB’s
24 from past industrial and mining activities. Water quality in the area is further
25 impaired because of mercury, and a health advisory has been issued for the entire
26 San Francisco Bay estuary (California Regional Water Quality Control Board,
27 San Francisco Bay Region 1997) because of mercury levels in aquatic life.
28 Smaller drainages that drain primarily urban areas, such as Novato Creek, are
29 impaired by persistent household insecticides, such as Diazinon.

30 **Table 4-4.** Waters in the San Pablo Bay and Tributary to the Bay Listed as
31 Impaired by the San Francisco Bay Regional Water Quality Control Board under
32 Section 303(d) of the Clean Water Act

Water Body/Waterway	Listed Impairment (Pollutant)
San Pablo Bay	Chlordane, DDT, Diazinon, Dieldren, Furan, Dioxin, PCBs, Cu, Hg, Ni, Se, coliform, exotic species
Napa River	Nutrients, Pathogens, Sedimentation/Siltation
Novato Creek	Diazinon
Petaluma River	Nutrients, Pathogens, Sedimentation/Siltation
Sonoma Creek	Nutrients, Pathogens, Sedimentation/Siltation
San Francisco Bay, North	Diazinon, Chlordane, DDT, Dieldren, Dioxin, Furan, PCBs, Cu, Hg, Se, exotic species

33
34

1 In addition to impaired water bodies identified by the SWRCB, the RWQCB has
2 identified toxic hot spots where Bay sediments are contaminated. Table 4-5 lists
3 the toxic hot spots in the San Pablo Bay and the contaminants found at each site.

4 **Table 4-5.** Areas in the San Pablo Bay that Have Significant Sediment
5 Contamination

Site	Pollutants Present
Mare Island Naval Shipyard	As, Ag, Cr, Cu, Hg, Zn, TBT, PAHs, PCBs, dieldrin, endrin toxaphene
Hamilton Army Airfield	Cr, Hg, Pb, PAHs, PCBs, DDT, petroleum

8 The *Hazardous Substances and Waste* section of this chapter discusses in greater
9 detail mercury in San Pablo Bay, Novato Creek, and dredged material, including
10 discussion of sediment screening criteria.

11 Site-Specific Water Quality Conditions

12 The existing soil conditions are important in determining water quality at the
13 proposed wetland restoration site. The site is a former tidal salt marsh and
14 mudflat. Soils in this area can affect water quality because of the presence of
15 acid-sulfate soils. These soils have a low pH (high acidity) and are the result of
16 draining the historic salt marsh and the subsequent natural processes that
17 occurred with the oxidation of sediments that had previously been submerged
18 and under anaerobic (oxygen-deprived) conditions. Acid-sulfate soil conditions
19 may affect the quality of runoff because low pH levels can lead to water quality
20 problems, such as release of sulfuric acid, aluminum toxicity and the potential for
21 release of other metals, and fluctuations in nutrient levels.

22 Urban Runoff

23 Urban runoff from the adjacent properties is collected by a series of storm sewers
24 and drainage channels to Pacheco Pond and then to Novato Creek. Natural areas
25 have been disturbed over the years by grading and development. Runoff from
26 paved areas is generally rapid. Water quality of runoff from the remaining
27 natural, wooded, or grassy areas is likely to be good. Urban runoff from paved
28 areas and other impervious surfaces can contain a variety of pollutants that can
29 degrade water quality. Pollutants commonly found in urban runoff include heavy
30 metals and petroleum hydrocarbons. The historic discharge of urban runoff from
31 the former HAAF, adjacent to the expansion site, has affected the upper intertidal
32 zone of the salt marsh near the pump station outfall. Elevated levels of metals,
33 including high lead levels, and petroleum hydrocarbons have been found in

1 sediments in this area. The solvent trichloroethylene and metals have been found
2 in the perimeter drainage channel.

3 **Pacheco Pond**

4 Pacheco Pond receives flow from Arroyo San Jose and Pacheco Creek, as well as
5 stormwater runoff from the Ignacio Business Park. Pacheco Creek, runs through
6 the northwest portion of the former HAAF. Ongoing monitoring of a closed
7 landfill and an MTBE groundwater plume at HAAF, approximately 2,400 feet
8 upgradient of the pond, has not shown migration of contaminants from the
9 landfill or plume in the direction of the pond. The Corps has completed
10 extensive environmental investigations at the airfield and runways and
11 discovered no evidence of other contaminants migrating from HAAF towards
12 Pacheco Pond (San Francisco Regional Water Quality Control Board 2001a).

13 In 2000 and 2001, there were several reports made to RWQCB of potential water
14 quality problems in the pond. After a report of health problems by local sheriff's
15 divers, RWQCB staff conducted an area-wide search of storm drains and runoff
16 in the vicinity of the pond but did not identify an obvious pollution source.
17 Water samples taken by RWQCB staff in mid December and again in late
18 January detected a low level of MTBE at Pacheco Creek, within its historical
19 concentration range, and benzoic acid at 100 parts per billion in the Pacheco
20 Pond. Benzoic acid is used in the manufacture of cosmetics and creams; it has a
21 half-life of 1 to 10 days in soil and water (San Francisco Regional Water Quality
22 Control Board 2001a).

23 RWQCB staff received a complaint of a strong sulfur smell and dead fish at
24 Pacheco Pond on April 2001. The complainant indicated that tide gates had been
25 removed between the lower portion of the creek and the pond, causing swift
26 water flows and pond flushing, and reported a milky white suspension of
27 sediment over about three-quarters of the pond, as well as dead insects and fish.
28 Preliminary results of 7 water samples taken by the complainant over a 20-hour
29 period indicated slightly elevated pH in 1 sample and total suspended solids in
30 excess of what is typically observed in stormwater runoff at 2 locations.
31 According to RWQCB, the pH level reflects slight alkalinity but probably not
32 enough to cause adverse effects to humans or wildlife. Sulfides in water were
33 detected on the day following the incident, which is typical of small water bodies
34 with low circulation (San Francisco Regional Water Quality Control Board
35 2001a).

36 Between 2000 and 2001, County staff participated in a Baseline Stormwater
37 Program to establish TMDLs in the San Francisco Bay Area. In cooperation with
38 RWQCB and other Bay Area counties, the County staff collected sediment
39 samples at various locations. Samples were taken along Pacheco Creek, storm
40 drain outfalls, and from Pacheco Pond. The sampling effort focused on mercury,
41 PCBs, and organochlorine pesticides (Kinetics Laboratories 2002). Results of the
42 County's sampling revealed concentrations of chlordane and DDT higher than

1 would typically be expected for ambient levels for North Bay creeks. The
2 highest concentration of chlordane was detected at a storm drain outfall
3 downstream of Ignacio business park and nearby Ignacio trailer park.
4 Concentrations of DDT were highest at a location in Pacheco Creek that is within
5 the boundary of the former HAAF. Although the pesticide concentrations were
6 higher than ambient, they do not reflect levels that would be expected to cause
7 immediate toxicity to fish or aquatic life, according to RWQCB (San Francisco
8 Regional Water Quality Control Board 2001b).

9 To date, RWQCB has not identified an apparent link between the reported fish
10 kills in spring 2001 and the sediment data received. RWQCB and County staff
11 have identified concerns that lack of aeration and circulation in Pacheco Pond,
12 combined with stormwater runoff, may potentially be reducing dissolved oxygen,
13 thereby causing periodic toxicity. The sulfur odors may also be derived from
14 naturally occurring hydrogen sulfide that accumulates in the sediments and is
15 released during pond flushing (San Francisco Regional Water Quality Control
16 Board 2001b).

17 In 2002, the Friends of Novato Creek (FNC) submitted a request to RWQCB to
18 list Pacheco Pond as an impaired water body because of its poor water quality
19 resulting from both sediment and pathogens. Contact with RWQCB staff
20 identified that RWQCB has reviewed the FNC request and material submitted,
21 and has determined that listing of Pacheco Pond, as an impaired water body is
22 not warranted at this time. The RWQCB stated that it was aware of the issues
23 related to Pacheco Pond and would continue to observe it for changes in water
24 quality (Moore pers. comm.).

25 **Permitted Discharges**

26 Novato Sanitation District (NSD) discharges treated wastewater through a 54-
27 inch reinforced-concrete pipe into San Pablo Bay. The outfall line follows the
28 boundary between the SLC and HAAF parcels and discharges through a diffuser
29 about 900 feet offshore into the intertidal zone of the Bay. Before the treated
30 wastewater is discharged into the Bay, the NSD dechlorination plant performs
31 final treatment of the wastewater discharge stream. Treated wastewater is
32 discharged only during winter and spring months. During the balance of the year
33 the treated wastewater is recycled and used for irrigation.

34 **Groundwater**

35 The shallow groundwater at the proposed wetland restoration site has a high
36 salinity because of the historic influence of San Pablo Bay. Groundwater is of
37 poor quality and is not used as a potable water source. A deep, higher-quality
38 aquifer is present at an unknown depth. Because of the prevalence of bay muds,
39 runoff is unlikely to recharge the deeper groundwater under the wetland
40 restoration site. Groundwater may be influenced by freshwater levels in Pacheco

1 Pond and may be less saline near the pond. The general direction of groundwater
2 flow is to the east (Woodward-Clyde 1985). However, the low transmissivity of
3 bay muds greatly reduces the movement of shallow groundwater into San Pablo
4 Bay. Groundwater also discharges to the interior drainage channels and is
5 pumped to San Pablo Bay.

6 Groundwater quality in the adjacent HAAF and SLC parcels has been affected by
7 contaminants. The main contaminants of concern that have been found in
8 groundwater are petroleum hydrocarbons, such as gasoline and oils, and solvents.
9 These contaminants are discussed in more detail in the *Hazardous Substances*
10 *and Waste* section of this chapter.

11 **Wetland Water Quality**

12 Wetland water quality is influenced by waterdepth and morphology and the
13 relationship of the wetland to the upstream watershed. The hydrologic regime
14 determines the frequency, depth, and duration of the water's influence on
15 vegetation and the aquatic functions that the wetland provides. Wetlands with
16 little flushing and high nutrient and contaminant loading rates can become
17 stagnant, resulting in low dissolved-oxygen content, decreased aquatic habitat
18 quality, and adverse effects on fish and wildlife. These conditions can also
19 promote excess algal growth and increase mosquito-breeding potential. An
20 adequate supply of fresh water to the wetland improves the capacity for removal
21 of nutrients and contaminants. In a salt marsh environment, adequate tidal
22 flushing maintains good water quality by reducing the potential for development
23 of these conditions.

24 Wetlands can improve the quality of source waters by decreasing water velocity,
25 inducing sediment deposition, and removing excess nutrients and contaminants.
26 Nutrients and contaminants can adsorb (attach themselves) to sediments in a
27 wetland and be removed by deposition, chemical breakdown, and assimilation
28 into plant and animal tissues.

29 During wet season months, Novato Creek tends to have freshwater flows due to
30 high runoff conditions in the upstream drainage basin. During summer months,
31 freshwater flows are low or negligible, and most of the water in the creek is from
32 the Bay. Turbidity can be high because of the relatively shallow depths of water
33 and the substantial currents that resuspend bottom sediments. Tidal flows,
34 however, nourish and sustain the salt marsh habitat along the levee at the east end
35 of the proposed wetland restoration site, HAAF, and the SLC parcel adjacent to
36 San Pablo Bay.

Environmental Consequences and Mitigation Measures

Approach and Methods

Water quality effects were evaluated qualitatively based on professional judgement because detailed pollutant transport and fate numerical models are not available. Based on the environmental setting information, all sediments in the Bay are contaminated to some degree by anthropogenic activities. Restoration, by natural sedimentation or dredge placement methods, would result in redistribution of Bay sediments and associated pollutants and would result in release of a portion of these pollutants into the overlying water column.

Potential water quality impacts were identified by comparing the proposed wetland restoration alternatives to the applicable laws and regulations regulating water quality in California. The water quality analysis also relies on other sections in this chapter, especially *Geology and Soils*, *Surface-Water Hydrology and Tidal Hydraulics*, and *Hazardous Substances and Waste*.

Impact Mechanisms

Exceedance of Water Quality Objectives due to Dredged Material Placement Activities

The primary water quality concern associated with placement of dredged material (Alternatives 1 and 2) is the potential for formation of acid-sulfate soils. During the drying process, sulfides formed under anaerobic conditions while submerged are oxidized to sulfate, which then forms sulfuric acid on contact with water from runoff or rain. The acidic conditions and low pH (<5.5) can adversely affect aquatic life and wetland vegetation.

Other water quality issues associated with wetlands created with dredged material include:

- increasing concentrations of sulfide, ammonia, and phosphorus in brackish water and freshwater environments to levels exceeding those permitted by water quality objectives, both in drainage water from recently placed dredged material and in leached runoff after placement; and
- increasing concentrations of heavy metals in drainage water after placement of dredged material as a result of the conversion of soil chemistry from anaerobic (reducing) to aerobic (oxidizing) conditions, which increases the dissolved, readily soluble concentration of many heavy metals.

Dredged material could contain contaminants and other chemical constituents that pose a threat to water quality. There are several upland and aquatic

1 pathways by which contaminants can threaten water quality in a wetland
2 environment. The contaminant pathways are:

- 3 ■ effluent discharge;
- 4 ■ runoff;
- 5 ■ leachate runoff;
- 6 ■ seepage by soluble diffusion and soluble convection through tidal pumping
7 and capillary action; and
- 8 ■ bioturbation, which includes the physical and biological activities that occur
9 at or near the sediment surface that cause the sediment to become mixed.

10 These pathways also indicate the biotic resources potentially affected by the
11 mobilization and accumulation of toxic contaminants. Water quality degradation
12 could occur initially in surface water that comes into contact with levees or
13 wetland slopes. As seepage of surface water and leachate from sediment occurs,
14 degradation of shallow groundwater could also occur.

15 Dredged sediment with chemical concentrations less than the concentrations
16 listed in the *Hazardous Substances and Waste* section is acceptable for potential
17 use in all wetland creation projects at any depth within the wetland (Wolfenden
18 and Carlin 1992). Dredged material at lower concentrations is also acceptable
19 for levee restoration and maintenance, landfill daily cover, and upland creation.
20 The BMKV expansion would accept only dredged material that meets cover-
21 material criteria.

22 **Exceedance of Water Quality Objectives due to Natural** 23 **Sedimentation Restoration Strategies**

24 Water quality issues associated with wetlands created without dredged material
25 (Alternative 3) are related to maintaining adequate flow and circulation. The
26 hydrologic regime determines the frequency, depth, and duration of the water's
27 influence on vegetation and the aquatic functions that the wetland provides.
28 Wetlands with little flushing and high nutrient and contaminant loading rates can
29 become stagnant, resulting in depressed dissolved-oxygen content, decreased
30 aquatic habitat quality, and adverse effects on fish and wildlife. These conditions
31 can also promote excess algal growth, generate noxious odors, and increase
32 mosquito-breeding potential.

33 **Exceedance of Water Quality Objectives due to Wetland** 34 **Creation**

35 Mercury has been introduced as a contaminant into the San Francisco Bay
36 environment in various chemical forms from a variety of anthropogenic sources.

1 In the San Pablo Bay specifically, mercury was introduced from gold mining in
2 the Sierra Nevada

3 Although mercury often resides in forms that are not hazardous, it can be
4 transformed through natural processes into extremely toxic methylmercury.
5 Monomethylmercury is reported as the most bioavailable and biologically
6 persistent form of mercury and is known to work its way up the food chain to
7 cause serious illness and death in humans. The largest contributors of
8 methylmercury in the environment appear to be sulfate-reducing bacteria, which
9 occupy the anoxic sediment just below the sediment-water interface in water
10 bodies and salt marshes.

11 Disturbance of mercury-contaminated sediments that were previously
12 sequestered in biologically unavailable deep sediments has the potential to
13 release mercury bound to sediments and sulfides. In addition, oxidizing
14 conditions that occur during placement of materials can cause mercury and
15 sediments to be released into overlying waters. Once released these mercury
16 cations become biologically available for mercury-methylating bacteria. The
17 resultant concentration of methylmercury is dependent on numerous variables:
18 salinity, pH, vegetation, sulfur concentration, dissolved organic carbon, ox/redox,
19 and seasonal variations in each of the identified variables.

20 **Exceedance of Water Quality Objectives due to Spillage** 21 **Associated with Diesel Off-Loading and Booster Pumps**

22 Diesel fuel may be spilled if diesel off-loading and booster pumps are used to
23 pump dredged material from the off-loader onshore.

24 **Exceedance of Water Quality Objectives due to Changes** 25 **in Circulation of Pacheco Pond**

26 The restoration alternatives include diversion of some or all of Pacheco Pond
27 outlet flows from Novato Creek to the restoration site. Each alternative also
28 includes expansion of Pacheco Pond. These changes may change circulation in
29 Pacheco Pond, which may affect water quality.

30 **Thresholds of Significance**

31 The following significance criteria were used to evaluate the proposed BMKV
32 expansion. Regarding water quality, the proposed expansion was identified as
33 resulting in a significant impact on the environment if it would

- 34 ■ violate any water quality standards or waste discharge requirements,
- 35 ■ substantially degrade surface water and/or groundwater quality,

- 1 ■ contaminate a public water supply,
- 2 ■ substantially increase suspended solids in and turbidity in receiving waters,
- 3 or
- 4 ■ discharge contaminants into the waters of the United States.

5 **Impacts and Mitigation Measures of No-Action** 6 **Alternative**

7 Under the No-Action Alternative, the proposed wetland restoration site would
8 remain in its present condition and drainage facilities would continue to be
9 operated and maintained by the owner. Therefore, the No-Action Alternative
10 would have no water quality effects.

11 **Impacts and Mitigation Measures Common to** 12 **Alternatives 1–3**

13 **Impact WQ-1: Potential for Degradation of Surface Water** 14 **and Sediment Quality due to Increased Methylmercury** 15 **Formation Potential**

16 As previously described, mercury has been introduced as a contaminant into the
17 San Francisco Bay environment in various chemical forms from a variety of
18 anthropogenic sources.

19 Although mercury often resides in forms that are not hazardous, it can be
20 transformed through natural processes into extremely toxic methylmercury.
21 Monomethylmercury is reported as the most bioavailable and biologically
22 persistent form of mercury and is known to work its way up the food chain to
23 cause serious illness and death in humans. The largest contributors of
24 methylmercury in the environment appear to be sulfate-reducing bacteria, which
25 occupy the anoxic sediment just below the sediment–water interface in salt
26 marshes.

27 Natural accretion processes in salt marshes continually supply fresh layers of
28 sediment that release mercury cations and provide the environment for the
29 methylation process. Once released, these mercury cations become biologically
30 available for mercury-methylating bacteria. The resultant concentration of
31 methylmercury is dependent on numerous variables: salinity, pH, vegetation,
32 sulfur concentration, dissolved organic carbon, ox/redox, and seasonal variations
33 in each of the identified variables.

34 Although it is likely that mercury methylation would increase as a result of the
35 dredged placement approach, it is not clear whether the act of placement causes

1 more notable effects than the natural methylation processes. As discussed in the
2 *Hazardous Substances and Waste* section of this chapter, in addition to dredged
3 material placement, sediment from Novato Creek or San Pablo Bay may also
4 provide a source of mercury that may be methylated in the restored wetland area.
5 It is also not currently possible, although models are being developed, to estimate
6 the methylmercury concentrations and bioaccumulation and biomagnification in
7 the food chain. Because a clear conclusion cannot be made regarding the
8 potential for a significant adverse effect on the environment, this impact is
9 considered significant and unavoidable. To minimize this effect, the following
10 mitigation measure should be implemented.

11 **Mitigation Measure WQ-1: Implement Methylmercury Adaptive**
12 **Management Plan.**

13 An adaptive management plan will be developed and implemented to address
14 methylmercury production and accumulation in the restoration site. The plan
15 should be developed in consultation with the responsible regulatory agencies
16 (RWQCB, BCDC, Corps, NMFS, USFWS, federal EPA, DFG, etc.). Staff of
17 these agencies should be part of the adaptive management team to guide
18 development of the plan; determine the duration, frequency of monitoring,
19 constituents to be monitored, and monitoring protocols; and develop corrective
20 actions as needed to minimize the adverse effects of methylmercury.

21 As noted above, water quality models are currently being developed to evaluate
22 methylmercury concentrations. Once appropriate models are developed and
23 adopted, they will be used to help develop the proposed methylmercury adaptive
24 management plan.

25 Key elements of this plan would include water- and sediment-quality monitoring,
26 hydrodynamic monitoring, and benthic invertebrate monitoring. Monitoring
27 would be conducted for at least 10 years post-breach. The purpose of the
28 monitoring would be to determine whether methylmercury concentrations are
29 found at substantially greater concentrations in the water column, sediments, or
30 benthic invertebrate population at the restoration site than at reference sites.

31 Although it is generally thought that restoring large areas of salt marsh
32 throughout the San Francisco Bay region is beneficial to the environment, large-
33 scale restoration projects could expose populations of special-status species to
34 methylmercury for many years. In addition, there is a potential for human health
35 risks should increased production of methylmercury occur that results in
36 increased mercury concentrations in fished species. The likely outcome of the
37 adaptive management plan will be informed decision making that will guide the
38 phased restoration of salt marshes throughout the San Francisco Bay.

1 **Impact WQ-2: Potential Degradation of Groundwater**
2 **Quality**

3 Inundation of the expansion area could degrade shallow groundwater through
4 saltwater intrusion or leaching of hazardous materials. However, the shallow
5 groundwater in the expansion area already has a high salinity because of the
6 historic influence of San Pablo Bay. Because of the presence of bay muds at the
7 site, surface water and shallow groundwater are unlikely to recharge deeper
8 groundwater. Saltwater intrusion and leaching of hazardous materials are
9 therefore unlikely to occur. This impact is considered less than significant, and
10 no mitigation is required.

11 **Impact WQ-3: Potential for Degradation of Water Quality**
12 **in Restored Wetlands from NSD Discharges**

13 NSD seasonally discharges treated wastewater to the intertidal zone of San Pablo
14 Bay. The overall NSD discharge flow rate is approximately 0.01% of the
15 average tidal flow discharge in San Pablo Bay. Diffusion and mixing by the tidal
16 and wind-driven circulation in the Bay provide ample opportunity for dilution of
17 the wastewater discharge stream. Because of the high degree of dilution that the
18 discharge stream undergoes upon release into San Pablo Bay and the relative
19 separation of the diffuser from the entrance channels of the proposed tidal
20 wetlands, the impact of return flows from the NSD facilities entering the
21 proposed tidal wetlands is considered less than significant, and no mitigation is
22 required.

23 **Impact WQ-4: Beneficial Increases in Dissolved Oxygen**
24 **Concentration in Receiving Waters.**

25 Increasing the water surface of the Bay increases the potential gas exchange rate
26 with the atmosphere, which would result in an increase in dissolved oxygen
27 concentration in the Bay. Increased dissolved oxygen would increase the
28 productivity of lowest levels of the food chain. Increased productivity would
29 benefit all higher trophic-level organisms, such as anadromous fish (salmon and
30 steelhead), resident fish, and piscivorous birds. Therefore this effect is
31 considered a beneficial impact on the environment.

32 **Impact WQ-5: Potential Exceedance of Water Quality**
33 **Objectives due to Inadequate Flushing in Restored**
34 **Wetlands**

35 As described above under *Impact Mechanisms*, implementation of the proposed
36 wetland restoration could create a water body with inadequate freshwater or tidal
37 flushing and result in stagnation, resulting in depressed dissolved-oxygen
38 concentrations and algal blooms. Assuming adequate flow and the absence of

1 hazardous materials, water quality in created wetlands would probably be similar
2 to that of incoming water sources such as Novato Creek, Pacheco Creek, and San
3 Pablo Bay. This impact is considered less than significant, and no mitigation is
4 required.

5 **Impact WQ-6: Potential Diesel Pump Spills into San Pablo**
6 **Bay**

7 Operation and fueling of the diesel off-loading and booster pumps could result in
8 spills of diesel into San Pablo Bay. This impact is considered significant, and the
9 following mitigation should be implemented to mitigate this impact to a less-
10 than-significant level.

11 **Mitigation Measure WQ-2: Provide for Spill Protection at Off-Loader**
12 **and at Booster-Pump Facility.**

13 Design of the off-loader will include spill curtains, double-containment, or other
14 design measures to reduce the potential for diesel fuel or engine oil to enter San
15 Pablo Bay during pump operation, fueling, or maintenance. Institutional
16 controls, such as adoption of a safety plan, will also be implemented to further
17 provide spill protection.

18 **Impact WQ-7: Potential for Changes in Salinity Levels**
19 **within Novato Creek**

20 Diverting some or all of the existing outlet that flows from Pacheco Pond to
21 Novato Creek could lead to changes in the salinity levels in Novato Creek.
22 Under existing conditions, there is minimal discharge from Pacheco Pond, which
23 is turn is limited by a tide gate that is located between the outlet channel and
24 Novato Creek. During low-flow summer conditions, the flow from Pacheco
25 Pond is minimal compared to the daily tidal prism on Novato Creek, and salinity
26 levels within the creek are controlled by San Pablo Bay. During high flow
27 conditions (i.e., during a storm event), overflows from Pacheco Pond and higher
28 flows from Novato Creek push any saline waters out to the Bay. As soon as a
29 storm event is over and high flows subside, salinity levels within the creek return
30 to the background salinity of San Pablo Bay. The addition of freshwater from
31 Pacheco Pond likely has a negligible effect on the salinity levels of Novato Creek
32 because the resulting high flows from a storm event already cause a change in the
33 creek's salinity levels due to an influx of freshwater flows. Pacheco Pond would
34 add a few more hours, at most, of freshwater outflow to the creek during a storm
35 event. The impact of diverting some or all of the outlet flows is thus considered
36 less than significant.

Impact WQ-8: Potential Changes to Circulation in Pacheco Pond

RWQCB and County staff have identified that low circulation in Pacheco Pond combined with high summer temperatures could cause excess algal growth, leading to a reduction in the amount of dissolved oxygen in the water. This may be the cause of recent reported water quality problems in the pond (City of Novato 2001; San Francisco Regional Water Quality Control Board 2001a, 2001b).

Implementation of the alternatives would result in redirection of some or all of the existing pond outlet flows to the restoration site in the wet season. In dry season, drainage would be as at present, through the existing outlet to Novato Creek. Development and implementation of a new water management plan for the pond, in cooperation with MCFCWCD and CDFG, is included as part of the project. If the outlet invert were set at the existing pond target elevation of 1.5 feet NGVD (as described in the conceptual design in chapter 3), then managed elevations of the pond would not change, thereby avoiding expansion of shallow portions of the pond that could otherwise exacerbate algal growth. If the outlet invert were set at elevations lower than the current target elevation, then the project could result in an expansion of shallow portions of the pond.

Under each alternative, the design feature for Pacheco Pond includes an expanded pond. A larger volume of water could be more susceptible to wave action and thus enhance wind-derived circulation. However, in the dry season when temperatures are high and the pond receives limited inflow, the proposed expansion in pond volume, with no change in inflow, could exacerbate low dissolved-oxygen levels. Some or all of the flow would be diverted during the wet season, but water would not be diverted from the pond during the the dry season. Because the changes included under the alternatives have the potential to exacerbate apparent water quality conditions in Pacheco Pond, this impact is considered significant. The following mitigation is recommended to reduce this impact to less than significant.

Mitigation Measure WQ-3: Incorporate Pacheco Pond Water Quality Concerns Regarding Circulation in New Water Management Plan, in Cooperation with MCFCWCD and CDFG.

Water quality considerations regarding circulation will be taken into account during development of the new water management plan. MCFCWCD, in cooperation with CDFG and the Conservancy, Corps, or their successor in interest, will develop a water quality management plan for Pacheco Pond prior to commencement of restoration activities. This plan will need to take into account the changes in pond outlet flows, construction of a new pond outlet, and potential expansion of the pond. The plan will also take into account water quality concerns regarding circulation and may require additional studies of the circulation of the pond prior to establishing appropriate outlet design to BMKV and prior to establishing operating procedures. The plan will be developed in conjunction with final design of the wetland restoration project.

Impacts Common to Alternative 1 and Revised Alternative 2

Impact WQ-9: Potential for Degradation of Receiving Water Quality due to Dredged Material Placement

Construction of the restoration site using the dredged placement approach would include hydraulic placement of fill material. Dredged material would be pumped with water, as a slurry, from barges in the Bay to the restoration site. Once in the restoration site, the solids in the slurry would settle, and new slurry would be added. The surplus water would need to be pumped out of the restoration area and disposed of in the Bay. This surplus water, depending on the detention time, could have substantial concentrations of fines that would degrade the receiving waters by increasing the suspended solids and turbidity. Increases in suspended sediments and turbidity in the receiving waters is considered a significant impact. To reduce this impact to a less-than-significant level, Mitigation Measure WQ-3, described below, would be implemented.

Placement of dredged sediments would result in the saturation of existing acid-sulfate soils. Such conditions could affect the quality of runoff from the active construction area because of the low pH levels. The water quality problems associated with low pH include release of sulfuric acid, aluminum toxicity and the potential for release of other metals, and fluctuations in nutrient levels. These constituents could be discharged to San Pablo Bay or leach through onsite soils to groundwater. However, the procedure used to create wetlands (i.e. drainage into a water quality detention pond prior to discharge) would greatly dilute the small amount of sulfuric acid that could be released. Therefore this impact is considered less than significant.

The proposed BMKV expansion could also result in potential leaching of contaminants from dredged sediments, physical erosion and transport of the sediment by surface water currents and runoff, and selective uptake and biomagnification of contaminants in plants and animals. However, the sediments selected for use as cover material for tidal and seasonal wetland restoration at the expansion site would need to meet the RWQCB screening criteria, which would minimize the potential for bioaccumulation. Maintaining wet, anoxic sediment conditions would minimize pH changes and increases in leachability of heavy metals and other substances. Restricting disposal of sediments to those passing the cover screening criteria would ensure that no adverse impacts on surface-water quality would occur. This would be enhanced by the site design, which would promote sedimentation as a physical sink for incoming tidal sediment. Therefore, this impact is considered less than significant.

After the perimeter levee has been breached and full tidal circulation has been restored across the site, some of the dredged material would be remobilized. Tidal flows and velocities at the perimeter levee breach locations would increase localized erosion in the existing tidal slough channels and bordering marsh.

1 Remobilization of the dredged material by tidal currents and wind-generated
2 waves across the open fetches of the site would increase local turbidity and
3 sedimentation until the eroded material is redeposited. No substantial offsite
4 transport is anticipated. The impacts of increased turbidity and sedimentation
5 would be short term, and offsite transport would eventually be eliminated when
6 equilibrium is established in the restored tidal marsh and tidal sloughs. This
7 localized, short-term impact is considered less than significant because high
8 turbidity is characteristic of the water in dynamic tidal marsh environments.

9 **Mitigation Measure WQ-4: Develop and Implement Water Quality**
10 **Monitoring Program for Dredged Material Placement.**

11 A water quality monitoring program will be developed and implemented to
12 ensure adequate protection for aquatic life. Before the construction phase is
13 initiated, water quality monitoring and reporting requirements for the proposed
14 BMKV expansion will be established by the San Francisco RWQCB in project-
15 specific WDRs in accordance with the Policy for Implementation of Toxics
16 Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California.
17 The WDRs will likely require sampling and analysis to provide background
18 water quality information on the project's discharge. The data will be used to
19 evaluate water quality of the discharge and determine compliance with the
20 WDRs. Monitoring and reporting requirements will be based on site-specific
21 conditions, such as beneficial uses, existing water quality, quality of dredged
22 material, and wetland management goals.

23 The monitoring program will be initiated before implementation of the proposed
24 BMKV expansion to determine background concentrations of constituents of
25 concern, and will continue during construction to identify any adverse impacts.

26 After placement of dredged material, water samples should be collected and
27 analyzed at frequencies ranging from monthly to quarterly and during both high
28 and low tides. Monitoring frequency may be reduced if data indicate that the
29 created wetland is in compliance with WDRs and is not adversely affecting water
30 quality. During dredged material placement, periodic monitoring should be
31 required for key constituents of concern, such as nitrate, ammonia, phosphorus,
32 and heavy metals. Other water quality parameters to be monitored include
33 salinity, temperature, pH, dissolved oxygen, and suspended solids.

34 Exceedance of monitoring standards may require temporary delays in material
35 placement or the installation of turbidity curtains or other physical measures to
36 control the flow of water and sediments. See separate discussion of
37 methylmercury in Impact WQ-1 above.

Impacts Unique to Alternative 3

Impact WQ-10: Potential for Spills from Fueling of Pump(s) at Pump Station

Operation and fueling of the relief pump(s) at the pump station for relief of high water (above 1.5' NGVD) in the BMK south lagoon could result in spills of diesel into Novato Creek, San Pablo Bay or the south lagoon. The specific design of the pump(s) has not been conducted, thus it is unknown if they would be electric or diesel. However, assuming they are diesel (or that at least a backup pump is diesel), fueling and operation could result in release of diesel fuel to the surrounding areas. This impact is considered significant, and if Alternative 3 were selected, the following mitigation should be implemented to mitigate this impact to a less-than-significant level.

Mitigation Measure WQ-5: Provide for Spill Protection at Pump Station.

Design of the pump station should include spill curtains, double-containment, or other design measures to reduce the potential for diesel fuel or engine oil to enter surrounding water bodies during pump operation, fueling, or maintenance. Institutional controls, such as adoption of a safety plan, should also be implemented to further provide spill protection.

1 **Public Health**

2 This section addresses the public health effects of implementing the proposed
3 BMKV expansion. Because of the potential for mosquito-borne disease, the
4 analysis focuses on the creation of potential breeding habitat for mosquitoes.

5 **Affected Environment**

6 **Data Sources**

7 Information presented in this section is based on the following data sources.

- 8 ■ *Hamilton Wetland Restoration Plan Final EIR/EIS* (Jones & Stokes 1998)
- 9 ■ *Environmental Analysis of Tidal Marsh Restoration in San Francisco Bay*
10 (San Francisco International Airport 2001)

11 **Mosquito Breeding Conditions**

12 Mosquitoes require standing water to complete their growth cycle. Any body of
13 standing water represents a potential breeding site for mosquitoes, with the
14 exception of ponded areas that are flushed daily by tidal action. These areas are
15 highly saline in nature and are not stagnant for a long enough period of time to
16 support the mosquito larvae to maturity (Tietze 2001).

17 Water quality affects the productivity of a potential breeding site for mosquitoes.
18 Typically, greater numbers of mosquitoes are produced in water bodies with poor
19 circulation, higher temperatures, and higher organic content than in water bodies
20 having good circulation, lower temperatures, and lower organic content (Collins
21 and Resh 1989). In addition, irrigation and flooding practices may influence the
22 level of mosquito production associated with a water body. Typically, greater
23 numbers of mosquitoes are produced in water bodies with water levels that
24 slowly increase or recede than in water bodies with rapidly fluctuating water
25 levels (Jones & Stokes Associates 1996).

26 Mosquito larvae flourish in stagnant water, particularly in small, protected
27 microhabitats provided by stems of emergent vegetation. Therefore, if not
28 properly maintained, ditches can be major producers of mosquitoes. Periodic
29 dredging of ditches substantially reduces mosquito production by enhancing
30 water circulation and preventing encroachment of emergent vegetation into ditch
31 channels. Mosquitoes are adapted to breed during periods of temporary flooding
32 and can complete their life cycles before water evaporates and predator
33 populations become well established. Poor drainage conditions that result in
34 ponding water, and water management practices associated with agriculture and

1 creation of seasonal wetlands for waterfowl use result in the types of flooding
2 that can produce problem numbers of mosquitoes (Jones & Stokes Associates
3 1996).

4 Permanent bodies of open water that have good circulation, low temperatures,
5 and low organic content typically sustain stable nutrient content and support rich
6 floral and faunal species diversity, including mosquito predators and pathogens.
7 In addition, wave action across large bodies of water physically retards mosquito
8 production by inhibiting egg laying and larval survival (Jones & Stokes
9 Associates 1996).

10 There are 2 broad types of mosquito production sources present in the expansion
11 area: habitats where water ponds permanently, and habitats where water ponds
12 seasonally. Within the expansion area, water ponds permanently in portions of
13 the drainage ditches on the BMKV site. Habitats that seasonally pond water in
14 the expansion area include brackish marsh, seasonal wetlands, agricultural
15 drainage ditches, and portions of cultivated fields that may pond water during the
16 wet season. Table 4-6 shows the estimated acreages of potential mosquito
17 breeding habitat in these areas. Within these areas, local suitability likely varies,
18 depending on the extent and duration of ponding and on site-specific salinities
19 and water currents.

20 **Table 4-6.** Estimated Acreages of Potential Existing and Post-Restoration
21 Mosquito Breeding Habitat in the Expansion Area

Habitat Type	Existing Habitat	Alternative 1	Revised Alternative 2	Alternative 3
Cultivated Fields (ponded areas within habitat)	1,241	-	-	-
Brackish Drainage Ditches	36	-	-	-
Grassland (ponded areas within habitat)	129 ¹			55 ¹
Seasonal Wetland	114	40	277	
Nontidal Salt Marsh	21	-	-	-
High Transitional Marsh	-	160	79	30
Open Water	15	40	21	40
Freshwater Emergent Wetland	-	10	12	10
Total	1,556	550	389	135

22 ¹Existing grasslands are low lying with poor drainage; upland/grassland areas in Alternatives 1
23 and Revised Alternative 2 would be sloped to facilitate drainage.
24

Marin–Sonoma Mosquito Abatement District

The expansion area is located within the jurisdiction of the Marin–Sonoma Mosquito Abatement District (MSMAD). Mosquito abatement districts (MADs) are governmental organizations formed at the local level that are responsible for controlling specific disease vectors within their jurisdiction. MADs receive most of their revenue from property taxes and are primarily responsible for controlling mosquitoes as pest species and as disease vectors. California law requires that if a problem source of mosquito production exists as a result of human-made conditions, the party responsible for those conditions are liable for the cost of abatement. The law is enforced at the discretion of the responsible MAD (California Health and Safety Code Section 2200 et seq.).

Although MADs do not have jurisdiction on state and federal lands, the Conservancy would coordinate with MSMAD to ensure that the proposed BMKV expansion does not create public health effects associated with the creation of new wetland habitat.

Criteria for Determining the Need for Control at a Mosquito Source

State laws and regulations require that mosquitoes be controlled if diseases transmitted by mosquitoes are identified in or near human populations, or if surveillance of mosquito populations for the incidence of mosquito-transmitted diseases indicates the likelihood of transmission (Jones & Stokes Associates 1996). The decision to control mosquitoes as a nuisance to human populations is at the discretion of each MAD. Factors influencing this decision may include the number of service calls received from a given locality, the proximity of mosquito sources to population centers, the availability of funds for abatement, the density of mosquito larvae present in a mosquito production source, and the number of adult mosquitoes captured per night in light traps (Jones & Stokes Associates 1996). Once a recurring mosquito production source has been identified, abatement schedules are often adopted and maintained for that source (Jones & Stokes Associates 1996).

Mosquito Control Methods

To reduce mosquito populations, MADs use a combination of various abatement procedures, each of which may have maximum effectiveness under specific habitat conditions or periods of the mosquito life cycle (Jones & Stokes Associates 1996). Mosquito control methods used by MADs include use of biological agents (e.g., mosquitofish, which are predators on mosquito larvae) in mosquito breeding areas, source reductions (e.g., drainage of water bodies that produce mosquitoes), pesticides, and ecological manipulations of mosquito breeding habitat.

Mosquito Habitat Conditions and Abatement Requirements for the Expansion Area

MSMAD abatement efforts in the expansion area are primarily focused on controlling mosquitoes that can transmit malaria and several types of encephalitis, or cause a substantial nuisance in surrounding communities. Of the wetland habitats in the expansion area, seasonal wetlands, brackish drainage ditches, and ponded areas within cultivated fields are considered to have the potential to produce problem numbers of mosquitoes that may act as vectors for diseases in the area. Table 4-6 summarizes the acreages of those habitats at the BMKV site with the potential to produce problem numbers of mosquitoes.

Environmental Consequences and Mitigation Measures

Approach and Methods

Changes in mosquito abatement requirements for the expansion area were evaluated through a comparison of existing potential mosquito habitat with post-restoration potential mosquito habitat.

Impact Mechanisms

Impact mechanisms include conversion of areas that do not currently provide breeding habitat for problem numbers of mosquitoes (e.g., grasslands and developed areas) to wetland habitats that have characteristics suitable for producing problem numbers of mosquitoes, and changes in water management practices resulting from implementation of the restoration alternatives.

Thresholds of Significance

The following significance criteria were used to evaluate the proposed BMKV expansion. Regarding public health, the proposed expansion was identified as resulting in a significant impact on the environment if it would result in habitat changes that would necessitate increasing levels of mosquito abatement programs to maintain mosquito populations at pre-construction levels. Habitat changes that could result in a substantial decline of available mosquito breeding habitat or greater efficiency of MSMAD's abatement program would be considered beneficial impacts.

Impacts and Mitigation Measures of the No-Action Alternative

No impacts on the level of mosquito production or MSMAD's abatement program would occur under the No-Action Alternative because the expansion area would remain under the existing conditions, and no change in the current level of service provided by the MSMAD would occur.

Impacts and Mitigation Measures Common to Alternatives 1–3

The public health impacts described below are common to all 3 alternatives.

Impact PH-1: Increase of Potential Mosquito Breeding Habitat

Approximately 550, 389, and 135 acres of potential mosquito habitat would be created with implementation of Alternative 1, Revised Alternative 2, and Alternative 3, respectively. However, these acreages represent a decrease in potential mosquito breeding habitat from the existing conditions on the expansion site, depending on the ponding potential of the cultivated fields currently onsite. During construction but before the perimeter levee is breached to establish tidal flow to portions of the site, surface water may pond in depressions created in portions of the work site as a result of excavation, filling, and grading activities. Areas that pond water for periods sufficient to allow production of adult mosquitoes could also provide temporary suitable habitat for mosquito production. Overall, a decrease in mosquito production would likely occur with implementation of Alternative 1, Revised Alternative 2, or Alternative 3. This would be a beneficial impact. Nevertheless, the following mitigation measure is recommended to ensure that suitable habitat for mosquito production remains controlled and properly regulated throughout construction and implementation.

Mitigation Measure PH-1: Coordinate Restoration Design and Expansion Activities with MSMAD.

The Conservancy and the Corps will consult and coordinate with MSMAD during design, implementation, and operations phases of the expansion. The Conservancy will be responsible for coordination with MSMAD regarding mosquito control measures for the expansion area following completion of construction. Consultation and coordination with MSMAD will include:

- 1 ■ development and implementation of water management strategies that reduce
2 site suitability for mosquito breeding;
- 3 ■ air and ground applications of Bti (*Bacillus thurigiensis* var. *israelensis*),
4 methoprene growth regulators, or other EPA-approved pesticides, as needed;
5 and
- 6 ■ consultation with MSMAD to perform ongoing monitoring of larval and
7 adult mosquito populations, water quality, and vegetation density, and to
8 implement control and management measures under the authority of
9 MSMAD.

1 **Biological Resources**

2 Biological resources evaluated for the proposed alternatives include native and
3 non-native aquatic and terrestrial habitats, special-status communities, special-
4 status plant and animal species, and species groups of high recreational interest.
5 This section describes existing biological resources present in the proposed
6 expansion area and potential impacts on biological resources that may occur with
7 implementation of the restoration alternatives.

8 Since the alternatives call for restoration of habitats, the description of site
9 habitats also provides an estimate of some of the habitat functions and values that
10 would be provided upon maturity of the habitats proposed for restoration to the
11 BMKV site. As noted in the impact assessment below, the context of the
12 proposed project as a restoration project designed to establish tidal wetland,
13 seasonal wetland, and other habitat components on the site was taken into
14 account when evaluating the significance of impacts on the existing biological
15 setting.

16 **Affected Environment**

17 **Data Sources**

18 Information presented in this section is based on the following data sources.

- 19 ■ *Bel Marin Keys Unit V Final Environmental Impact Report/Environmental*
20 *Impact Statement* (Environmental Science Associates 1993)
- 21 ■ *Delineation of Clean Water Act Jurisdiction on Proposed Bel Marin Keys*
22 *Project Site, Novato, CA* (LSA Associates 1997)
- 23 ■ *Special-Status Plant Surveys and Terrestrial Habitat Characterization of*
24 *Four Mitigation Complexes, San Francisco Airport Expansion Project* (May
25 & Associates 2001)
- 26 ■ *Hamilton Wetland Restoration Plan Final Environmental Impact*
27 *Report/Environmental Impact Statement* (Jones & Stokes 1998)

28 Common and scientific names of plant and animal species mentioned in the text
29 are presented in table D-1 in appendix D.

30 **San Pablo Bay (Regional Setting)**

31 The project site is located on the northwestern shore of San Pablo Bay. The San
32 Pablo Baylands area (including the project site) is composed of several types of
33 habitats that are important to estuary plant and wildlife species, including

1 subtidal channels, intertidal mudflats, tidal wetlands and sloughs (including tidal
2 salt marsh and tidal brackish marsh), diked historic baylands (including farmed
3 wetlands, seasonal wetlands, salt ponds, managed wetlands, and freshwater
4 marshes), streams and creeks (like the Petaluma River, Novato Creek, and
5 Gallinas Creek), and upland areas. As noted in chapter 2, development has
6 altered the habitats found in the baylands dramatically. The specific bayland
7 habitats found in and directly adjacent to the BMKV site are discussed in further
8 detail below.

9 **San Pablo Bay (Open Water Habitat)**

10 The following discussion of open water habitats is from the *Baylands Ecosystem*
11 *Habitat Goals Report* (Goals Project 1999). Bay habitats are tied to the baylands
12 and are components of the baylands ecosystem. They are important for aquatic
13 organisms, sea birds, and some mammals that move back and forth between deep
14 and shallow waters. Bay habitats are divided into 2 categories: areas of deep
15 water (deep bays) and areas of shallow water (shallow bays and channels).

16 The only parts of the project characterized as deep bays are the parts of the
17 project area that are deeper than 18 feet below MLLW. These are the
18 easternmost portions of the off-loading pipeline and the off-loading facility itself.
19 The sediments of deep bay and channel habitat vary widely in character, from
20 coarse sand to very fine clays and silts. In the parts of the Bay where currents are
21 strong, especially as in the deeper reaches of San Pablo Bay, the bottom is mostly
22 coarse sand. Deep bays and channels are important for aquatic invertebrates,
23 including California bay shrimp, Dungeness crab, and rock crab, and for fish
24 such as white sturgeon and brown rockfish. They also are migratory corridors
25 through which pass anadromous fish, including chinook salmon and steelhead.
26 Deep bays and channels are habitat for several species of water birds, including
27 brown pelican, double-crested cormorant, greater and lesser scaup, surf scoter,
28 and Caspian tern. Marine mammals such as harbor seal and California sea lion
29 are also utilize this habitat.

30 Shallow bays and channels include the portion of the project area where the
31 bottom is entirely between 18 feet below MLLW and MLLW. The sediments of
32 shallow bays and channels are primarily mud. Shallow bays and channels are
33 important for many invertebrates, fish, and water birds. This rich environment is
34 an especially productive feeding area for many fish, including splittail, northern
35 anchovy, and jacksmelt. It is also an important migratory corridor for
36 anadromous fish such as chinook salmon and steelhead. A few of the many bird
37 species that occur in this habitat include western grebe, American wigeon,
38 canvasback, Forster's tern, and least tern. Harbor seals and sea lions also utilize
39 this habitat.

Biological Communities—BMKV Expansion Site

The habitats present at the proposed BMKV expansion site and immediately adjacent include aquatic, wetland, and grassland communities and developed areas. A substantial portion of the expansion site is agricultural land. These habitats and the plant and wildlife species associated with the BMKV site are described below. The biological setting in and around Pacheco Pond is described separately. The distribution of habitat types within each area is presented in figure 4-8, and the acreage of each habitat type in each area at BMKV is presented in table 4-7. Habitat types and acreages are derived from the results of previous habitat inventories of the expansion area.

Aquatic Communities

Aquatic communities found in the expansion area immediately outside of the BMKV perimeter levees include subtidal aquatic (i.e., aquatic habitats that are never exposed during low tide), intertidal aquatic (i.e., emergent marsh habitat and mudflats that are exposed during low tides). In addition there are brackish open water habitats on the BMKV site in the drainage ditches and in one borrow pit. Each of these is described below. A schematic of typical aquatic habitats by tide levels is provided in figure 4-9.

Subtidal Aquatic Habitat

Subtidal aquatic habitat is located adjacent to the site in the deeper parts of Novato Creek and San Pablo Bay. Subtidal aquatic habitats are areas of continuous open water that are submerged during even the lowest tide; as a result, these areas are too deep to support the types of vegetation found in emergent (i.e., occasionally exposed) marsh habitat. Phytoplankton; zooplankton; and fish, such as longfin smelt, northern anchovy, speckled sand dab and staghorn sculpin, occupy subtidal aquatic habitat. Benthic (bottom-feeding) organisms such as worms and clams can be found in the sandy, muddy bottom. Many species of waterfowl and diving birds use subtidal aquatic habitat for feeding areas.

Intertidal Aquatic Habitat

Intertidal aquatic habitat is located adjacent to the site along the Novato Creek channel and outboard of the San Pablo Bay perimeter levee. Intertidal aquatic habitat comprises 2 subtypes of habitat: intertidal mudflats, and coastal salt marsh. Intertidal mudflats are made up of unconsolidated, muddy bottom areas without vegetation and are present along coastal salt marshes that are outboard of the perimeter levee. Mudflats are exposed twice daily during low tide and extend to the extreme low water elevation (figure 4-9). Narrow bands of mudflat are also found at the same elevations along the margins of subtidal channels in tidal marshes. Mudflats are highly productive and support large populations of benthic organisms, including aquatic worms, crustaceans, and mollusks, that are important elements of the estuarine food web. When exposed or covered by shallow water, mudflats provide important foraging areas for migrant and wintering shorebirds, wading birds, and gulls.

Table 4-7. Estimated Extent of Habitat Types (Acres) Present in the BMKV Site under the No-Action Alternative and Alternatives 1–3 at Year 50 after Project Implementation, and the Net Change in Extent of Habitat Types Restored Under the Project Alternatives from the No-Action Alternative

Habitat Type	No-Action Alternative (i.e., Existing Conditions)	Alternative 1		Alternative 2		Alternative 3	
	Acres	Acres	Net Change	Acres	Net Change	Acres	Net Change
Coastal Salt Marsh (Tidal)	18 ^a	1039 ^e	+1021	899 ^e	+882	1274 ^e	+1256
Coastal Salt Marsh (Nontidal)	21 ^b	0	-21	0	-21	0	-21
Tidal and Subtidal Channels	2	147	+145	120	+118	197	+195
Brackish Open Water and Emergent Marsh	63 ^c	50 ^f	-13	33	-30	50 ^f	-2
Seasonal Wetland	114 ^d	40	-74	277	+162	10	-104
Grassland (Upland)	129	300	+171	247	+119	45	-844
Agriculture (Non-Ponding)	1079	0	-1079	0	-1079	0	-1079
Agriculture (Ponding)	151	0	-151	0	-151	0	-151
Total	1576	1576	0	1576	0	1576	0

^a Includes 17.5 acres of tidal marsh outside of levees

^b Includes 5.8 acres of saline seeps and approx. 15 acres in Borrow Pits B and C

^c Includes 36.0 acres of drainage ditches and approx. 15.5 acres in Borrow Pit A

^d Includes 10.5 acres in western field, 24.9 acres in borrow pit field, and 79.0 acres in dredge spoil disposal field

^e Includes low marsh, tidal marsh, and high transitional marsh

^f Includes 40 acres of expanded Pacheco Pond and 10 acres of emergent marsh habitat

1 Coastal salt marsh is located adjacent to the site along the Novato Creek channel
2 and outboard of the San Pablo Bay perimeter levee. Coastal salt marsh contains
3 persistent, rooted herbaceous vegetation dominated by cordgrass and pickleweed.
4 The vegetation in the marsh habitat is used as direct cover and sources of food by
5 rearing juvenile and adult fish, such as longfin smelt, chinook salmon, and
6 steelhead. Emergent marsh habitat, however, is within the tidal zone and drains
7 frequently; it is therefore not used for spawning. Benthic organisms use this
8 habitat in the same way they use intertidal mudflats. Emergent marsh habitat
9 also provides nesting, foraging, and escape cover for various songbirds and
10 wading birds.

11 ***Brackish Open Water Habitat***

12 Brackish open water habitat occurs on approximately 52 acres of the BMKV site
13 and includes 1 of the borrow pits and the drainage ditches. Borrow Pit A is 10–
14 15 feet deep, intersects the water table year-round, and is perennially inundated
15 in all but drought years (LSA Associates 1997). Open water in the borrow pit
16 ponds is used by water birds during migration and provides foraging areas for
17 resident waterfowl (Environmental Science Associates 1993). The approximate
18 size of Borrow Pit A is 15 acres.

19 Drainage ditch banks and channels also provide foraging habitat and cover for
20 some species, such as herons, egrets, and dabbling ducks, as well as movement
21 corridors for striped skunks, raccoons, and other species. The area of the
22 drainage ditches is approximately 36 acres and includes small amounts of
23 brackish marsh vegetation along the edges of the ditches.

24 **Wetland Communities**

25 The expansion area contains 4 types of non-agricultural wetland communities:
26 coastal salt marsh (tidal), coastal salt marsh (nontidal), small amounts of brackish
27 marsh in the drainage ditches, and seasonal wetland (see table 4-7). In addition,
28 seasonal ponding occurs within the cultivated fields, though it varies in
29 magnitude from year to year. Delineation of jurisdictional wetlands has been
30 completed for the BMKV parcel (LSA Associates 1997) and has been verified by
31 the Corps and the Natural Resources Conservation Service (NRCS). All of the
32 non-agricultural wetland types, except brackish open water, are considered
33 jurisdictional wetlands by the Corps in accordance with the federal Clean Water
34 Act. Approximately 151 acres of cultivated fields have also been delineated as
35 jurisdictional agricultural wetlands based on determination of a statistically
36 derived average ponding area, in addition to vegetation and soils criteria (LSA
37 Associates 1997).

38 ***Coastal Salt Marsh (Tidal)***

39 Coastal salt marsh under tidal influence occurs in 2 locations in the expansion
40 area: east of the perimeter levee at the eastern end of the expansion area
41 between the levee and the open water of San Pablo Bay, and between the
42 northern levee and Novato Creek. Approximately 20 acres of salt marsh habitat
43 occur within the BMKV site, but more substantial areas are located outside the

1 site. This habitat can be divided into 3 distinct zones based on the frequency and
2 duration of tidal inundation (figure 4-9). These zones are described below.

- 3 ■ Low marsh habitat occupies the elevations between mean tide level and mean
4 high water and, as such, is inundated daily. In the expansion area, low marsh
5 is adjacent to the open waters of San Pablo Bay and Novato Creek and is
6 dominated by California cordgrass.
- 7 ■ Middle marsh habitat occupies the elevations between mean high water and
8 mean higher high water. It is predominant outboard of the perimeter levee
9 and is inundated frequently throughout each month, although for shorter
10 periods than low marsh. Middle marsh is dominated by common
11 pickleweed.
- 12 ■ High transitional-marsh habitat occupies the elevations between mean higher
13 high water and the highest tide level. This habitat is inundated infrequently
14 and for short periods. A narrow strip along the bayside of the levee supports
15 high marsh and plant species that are tolerant of saline conditions but not
16 adapted to frequent, long-term inundation, including saltgrass, alkali heath,
17 fat-hen saltplant, and gumplant.

18 The tidal coastal salt marsh community provides food, cover, and breeding
19 habitat for many wetland-dependent wildlife species. The dense vegetation and
20 large invertebrate populations typically associated with salt marshes provide
21 ideal foraging conditions for a variety of bird species, including rails, egrets,
22 herons, waterfowl, and shorebirds. In addition to being important habitat for
23 wetland-associated wildlife, the salt marsh community is an important
24 component of the San Pablo Bay ecosystem, providing nutrients and organic
25 matter to the mudflats and open water of the Bay. These, in turn, are important
26 habitats for a variety of waterfowl, shorebirds, and other water birds. Wildlife
27 species observed at the proposed wetland restoration site during field surveys
28 conducted in 2001 and 2002 include double-crested cormorant, great blue heron,
29 great egret, American coot, killdeer, northern harrier, salt marsh common
30 yellowthroat and San Pablo song sparrow (May & Associates 2001; Jones &
31 Stokes files 2002). Other species expected to use tidal coastal salt marsh include
32 the raccoon, mallard, sora, Virginia rail, and willet.

33 ***Coastal Salt Marsh (Nontidal)***

34 Small areas of coastal salt marsh vegetation that are not inundated by tides
35 (approximately 21 acres total) are located along the interior slopes and base of
36 levees along Novato Creek and San Pablo Bay and in 2 of the borrow pits.
37 Dominant species include pickleweed, saltgrass, brass buttons, ryegrass, and
38 coyote brush. These habitat areas may provide important refuge for wildlife
39 associated with tidal salt marsh during periods of extreme high tides
40 (Environmental Science Associates 1993).

41 ***Brackish Marsh***

42 Small amounts of brackish marsh vegetation are present along the edge of the
43 drainage ditches in the BMKV parcel. Dominant emergent wetland plants along

1 drainage ditches are alkali bulrush and cattail. Because marsh vegetation
2 associated with ditches occurs in narrow linear bands, these habitat areas
3 typically support a lower diversity of wildlife than larger, more contiguous units
4 of brackish marsh. The area of the brackish marsh vegetation has not been
5 estimated.

6 ***Seasonal Wetlands***

7 Areas of seasonal wetland (approximately 114 acres total) are present in the field
8 at the west end of the site, adjacent to the borrow pits, and in the field previously
9 used for placement of dredged material (on the northeast side of BMKV). Plant
10 species that may dominate in seasonal wetland habitat are saltgrass, alkali heath,
11 salt marsh bulrush, fat-hen saltplant, western goldenrod, sheep sorrel, 6-weeks
12 fescue, tall fescue, sedge, rush, and creeping wild rye (Environmental Science
13 Associates 1993).

14 Seasonal wetlands potentially provide high-tide refugia for California clapper
15 rail, California black rail, and other species that use tidal coastal salt marshes;
16 seasonal foraging and resting habitat for migratory shorebirds, waterfowl, and
17 other water birds; and foraging habitat for raptors, herons, egrets, blackbirds,
18 raccoons, striped skunks, and aquatic garter snakes (Environmental Science
19 Associates 1993).

20 ***Agricultural Wetlands***

21 During winter, some of the agricultural fields become saturated or seasonally
22 flooded with runoff from precipitation. Flooded fields provide foraging and
23 resting habitat for a wide diversity of wintering and migrant shorebirds,
24 waterfowl, and other water birds during winter. Based on a statistically derived
25 average ponding area, approximately 151 acres of agricultural wetlands have
26 been delineated on the BMKV site (LSA Associates 1997). Because ponding
27 amounts can vary in location and size by year, these areas have not been mapped.

28 ***Grassland Community***

29 Annual grassland vegetation in the expansion area (approximately 129 acres
30 total) is ruderal (i.e., grows in disturbed areas) and is dominated by weedy, non-
31 native annual grasses and forbs, such as ripgut brome, wild oats, Mediterranean
32 barley, perennial ryegrass, yellow star-thistle, curly dock, bristly ox-tongue, and
33 black mustard. Scattered shrubs and non-native trees, such as coyote brush,
34 blackberry, and eucalyptus, are also present in some grassland areas
35 (Environmental Science Associates 1993).

36 Annual grassland provides important habitat for various wildlife species.
37 Representative wildlife species observed using grasslands at the expansion site
38 are the turkey vulture, white-tailed kite, northern harrier, red-tailed hawk, golden
39 eagle, American kestrel, short-eared owl, savannah sparrow, western
40 meadowlark, and Brewer's blackbird (May & Associates 2001; Jones & Stokes
41 files). The previous EIR/EIS also mentions the following species observed onsite
42 or nearby that are likely to use the grassland areas and the agricultural areas:
43 short-eared owl, Cooper's hawk, and sharp-shinned hawk. Other common

1 species that use or are likely to use the grassland include Canada geese, coyote,
2 fox, skunk, deer, rabbits, raccoons, possums, ground squirrels, voles, mice, rats,
3 gophers, moles, and snakes. Many of these species will also use the agricultural
4 fields periodically throughout the year.

5 **Trees**

6 The BMKV site contains several groves of eucalyptus trees, including small
7 groves on the eastern side along a drainage ditch and in the center of the site near
8 the small house and equipment shed. Larger groves of eucalyptus are located
9 along the western levee adjacent to Pacheco Pond, and on and immediately
10 adjacent to Headquarters Hill. Headquarters Hill is on private land and is not
11 part of the restoration project. A red-tailed hawk nest was documented in the
12 eucalyptus grove in the prior EIS/EIR (Environmental Science Associates 1993).
13 Other hawks may also use site trees for nesting. The groves are also reportedly
14 used for roosting by a number of egrets, herons, raptors, and other bird species,
15 some of which may also nest in the groves. There are several isolated oaks on the
16 project site and a valley oak stand on Headquarters Hill (Environmental Science
17 Associates 1993).

18 **Agricultural Lands**

19 Most of the proposed wetland restoration site (approximately 1,241 acres) is
20 composed of agricultural fields that are planted and harvested annually.
21 Approximately 75% of these lands are managed for oat hay production.
22 Following the harvest, fields remain fallow until the following planting season.
23 When fallow, the fields typically support non-native invasive plants, such as star
24 thistle (Environmental Science Associates 1993). Cultivated fields, particularly
25 when fallow, provide habitat values similar to grasslands and provide habitat for
26 raptors, songbirds, and small mammals. As noted above, approximately 151
27 acres of the agricultural land have been delineated as agricultural wetlands.

28 **Developed Areas**

29 Human-made structures present within the expansion area include drainage pump
30 stations, small out buildings, and utility infrastructures. Compared to vegetated
31 habitats, these developed areas support a low diversity of wildlife. Species
32 commonly associated with developed areas include the barn swallow, northern
33 mockingbird, American crow, and European starling. Several owl species,
34 including several barn owls and a great horned owl, were observed inside the
35 barn on the western side of the site and in the equipment shed in the center of the
36 site; other owls or raptors may also use the structures. Several commenters on the
37 Draft SEIR/EIS mentioned possible use of the barns by bats. However, bats were
38 not observed during reconnaissance of these structures nor documented in the
39 prior EIR/EIS (Environmental Science Associates 1993).

40 **Biological Communities—HAAF and SLC Sites**

41 The habitats present at the HAAF and SLC sites were described in the 1998
42 EIS/EIR prepared for the HWRP, which is incorporated herein by reference.

Biological Communities—Land Currently Owned by the City of Novato West of HWRP (the “Bulge” parcel)

The habitat present on the land immediately west of the HWRP (known as the Bulge parcel) is discussed in this document because the Bay Trail would extend adjacent to this area under all 3 alternatives and the interpretive center and access area would be located in this area under Alternative 1 and Revised Alternative 2. This area consists of upland, seasonal wetland, concrete pads, and asphalt and dirt roads (see figure 4-8).

Upland areas are vegetated by upland and ruderal grasslands. The species include brome grasses, quaking grass, yellow star-thistle, paniced willow-herb, Italian thistle, bird’s-foot trefoil, and English plantain. Grasslands in the area have been classified previously as ruderal grassland. These areas are underlain by soils composed of fill. (Jones & Stokes 2002a)

No trees are present in the area to be crossed by the Bay Trail or at the proposed interpretive center/access area location. The grassland is considered only moderate-quality wildlife habitat because the area is fragmented by the runway and service roads. Representative wildlife species observed using grasslands at the adjacent HAAF project site are the gopher snake, western fence lizard, turkey vulture, red-tailed hawk, northern harrier, American kestrel, California quail, ring-necked pheasant, savannah sparrow, western meadowlark, Brewer’s blackbird, California vole, black-tailed hare, desert cottontail, black-tailed deer, coyote, striped skunk, and raccoon.

There are seasonal wetlands located in low-lying areas on the northern and southern side of this area (see figure 4-8). These seasonal wetlands are vegetated by annual grass and forb hydrophytes. The dominant species include Italian ryegrass, salt grass, alkali heath, fathen, and curley dock (Jones & Stokes 2002a).

In the center of this area, there is a large remnant concrete pad. This pad is surrounded by annual grassland and dirt and gravel roads (see figure 4-8). This is the proposed location of the interpretive center; the adjacent areas would be used for the access area.

Biological Communities—Pacheco Pond and Lower Portion of Tributaries

The general profile of existing biological resources in Pacheco Pond and the confluence of Arroyo San Jose and Pacheco Creek is based on the Hamilton Public Access Bay Trail Plan (City of Novato and California State Coastal Conservancy 2001), contact with MCFCWCD biologists, a field reconnaissance, and aerial photography.

Pacheco Pond is heavily used both in winter and summer by a wide range of water birds, including, grebes, loons, cormorants, rails, American white pelicans,

1 coots, moorhens, terns, gulls, herons, egrets, shorebirds, blackbirds, and other
2 waders and dabbling ducks. In winter, rafts of diving birds, including
3 canvasback and scaup, rest and feed in the pond (Marin Audubon Society 2002).
4 A number of species breed in the surrounding area due to the presence of a
5 surrounding cattail marsh that provides food and cover. The pond itself also
6 reportedly supports a number of fish species, including striped bass, smelt, and
7 bullhead.

8 The confluence of Pacheco Creek and Arroyo San Jose creates a riparian area on
9 the western side of Pacheco Pond that supports willows, non-native berries, and
10 other freshwater riparian species. Saltmarsh Common Yellowthroat has
11 previously been observed in the wetland/riparian area north and east of Ammo
12 Hill (U.S. Army Corps of Engineers 1996a). Song sparrow and green herons
13 have also been reported in the riparian area (Marin Audubon Society 2002).
14 Northwestern pond turtle has been found in or near this area (Lewis 2002). A
15 red-legged frog survey has been conducted in or near the confluence area, but no
16 frogs were located (Lewis 2002).

17 The outflow from Pacheco Pond discharges into Novato Creek via a leveed
18 channel, controlled by six flap gates. This structure apparently acts as a partial
19 barrier to anadromous fish, in that access from Novato Creek to the Pacheco
20 Pond outlet can only occur when flow from Pacheco Pond is sufficient to open
21 the flap gates. This should occur in the wet season, following rains, at low-tide,
22 but may not occur at all during summer. No self-sustaining runs of anadromous
23 fish are known to exist in Pacheco Pond or its tributaries. However, there are
24 anecdotal reports of salmon in Arroyo San Jose, and in December 2001, 3 adult
25 chinook salmon were reported spawning in Arroyo San Jose Creek above
26 Highway 101, upstream of Pacheco Pond (Lewis 2002). The reported
27 individuals may have gained access to the area during maintenance of the
28 Pacheco Pond outlet structure (Charlton 2002).

29 The presence of adult chinook salmon has been recorded in a number of rivers
30 and creeks draining into San Francisco and San Pablo Bays, however it is not
31 known whether any of these populations are self-sustaining (National Marine
32 Fisheries Service 1999). It is believed that present day adults may have
33 originated from numerous off-site releases of Central Valley hatchery fall-run
34 chinook salmon into the delta or bay (National Marine Fisheries Service 1999).
35 The chinook salmon reported in Arroyo San Jose were most likely fall-run
36 chinook of hatchery origin. Other runs of chinook salmon which migrate through
37 San Pablo Bay include winter and spring runs which typically spawn much
38 higher in the river systems (450 to 900 and 45 to 1,600 meters elevation
39 respectively) in upper mainstem reaches, higher streams, and the spring fed
40 headwaters (Myers et al. 1998).

41 Based on aerial photography and site reconnaissance, all of the area adjacent to
42 the confluence is wetland, as is the area between the northern end of the
43 MCFCWCD access road and Bel Marin Keys Boulevard.

1

Special-Status Species

2

Special-status species are plants and animals that are legally protected under the state and federal Endangered Species Acts (ESAs) or other regulations, and other plants and animals that are considered sufficiently rare to qualify for consideration under NEPA and CEQA. The categories for special-status plants and animals are described below.

3

4

5

6

7

- Species listed or proposed for listing as threatened or endangered under the federal ESA (50 Code of Federal Regulations [CFR] 17.12 [listed plants], 50 CFR 17.11 [listed animals], and various notices in the Federal Register [FR] [proposed species])

8

9

10

11

- Species that are candidates for possible future listing as threatened or endangered under the federal ESA (61 CFR 7596-7613, February 28, 1996)

12

13

- Species listed or candidates for listing by the State of California as threatened or endangered under the state ESA (14 CCR 670.5)

14

15

- Species that meet the definitions of rare, threatened, or endangered under CEQA (State CEQA Guidelines, Section 15380)

16

17

- Plants listed as rare or endangered under the California Native Plant Protection Act (CNPS) (California Fish and Game Code, Section 1900 et seq.)

18

19

20

- Plants considered by CNPS to be rare, threatened, or endangered in California (Lists 1B and 2 in California Native Plant Society [2001])

21

22

- Plants listed by CNPS as those about which more information is needed to determine their status and plants of limited distribution (Lists 3 and 4 in California Native Plant Society [2001]) that may be included as special-status species on the basis of local significance or recent biological information

23

24

25

26

27

- Animal species of special concern to DFG (Remsen 1978; California Department of Fish and Game and Point Reyes Bird Observatory 2001 [birds], Williams 1986 [mammals], Jennings and Hayes 1994 [amphibians and reptiles], and Moyle et al. 1995 [fish])

28

29

30

31

- Animals fully protected in California (California Fish and Game Code, Section 3511 [birds], 4700 [mammals], and 5050 [reptiles and amphibians])

32

33

Special-status plant and animal species that occur or have potential to occur in or near the expansion area and their likely status in the area are presented in table D-1 in appendix D.

34

35

36

Special-Status Plants

37

Fourteen special-status plant species have potential to occur in or near the expansion area (appendix D); however, they are not present in the BMKV parcel. No special-status plant species have previously been reported from the expansion area (California Natural Diversity Data Base 1997).

38

39

40

1 Potentially suitable habitat is present in the expansion area for only 3 of those
2 species: soft bird's-beak, Point Reyes bird's-beak, and Marin knotweed
3 (Environmental Science Associates 1993). This potential habitat is associated
4 with the transitional zone at the upper margins of coastal salt marshes. These
5 species were not found during rare plant surveys conducted in 1980, 1985, 1988,
6 1991, and 2001 (Environmental Science Associates 1993, May & Associates
7 2001). Therefore, this analysis assumes that no special-status plant species are
8 present in the expansion area or will be affected by the proposed BMKV
9 expansion.

10 **Special-Status Animals**

11 Nineteen special-status fish and wildlife species are known to occur or are
12 assumed to use suitable habitat within diked portions of the expansion area or in
13 marshes and aquatic habitats bayside of the perimeter levees or in areas
14 immediately adjacent to the BMKV site (see appendix D). These species are
15 listed below.

- 16 ■ Longfin smelt
- 17 ■ Steelhead (Central Valley and Central California Coast ESUs)
- 18 ■ Chinook salmon (Sacramento River Winter-run, Central Valley Spring-run ,
19 and Central Valley Fall-run ESUs)
- 20 ■ Coho salmon (Central California Coast ESU)
- 21 ■ Double-crested cormorant
- 22 ■ California brown pelican
- 23 ■ White-tailed kite
- 24 ■ Northern harrier
- 25 ■ Golden eagle
- 26 ■ Cooper's hawk
- 27 ■ Sharp-shinned hawk
- 28 ■ Peregrine falcon
- 29 ■ California clapper rail
- 30 ■ California black rail
- 31 ■ Short-eared owl
- 32 ■ Burrowing owl
- 33 ■ Saltmarsh common yellowthroat
- 34 ■ San Pablo song sparrow
- 35 ■ Salt marsh harvest mouse

1 **Invasive Non-Native Plant Species**

2 Several invasive non-native plant species are of concern in the San Francisco Bay
3 region. These plants often out-compete native vegetation, decrease species
4 diversity, and eliminate habitat features necessary for special-status wildlife
5 species. Of particular concern are several species of cordgrass, perennial
6 pepperweed, and stinkwort.

7 Smooth cordgrass spreads by fragmentation of the rhizomes and, less commonly,
8 by seed. Common cordgrass and dense-flowered cordgrass spread by both
9 methods. Salt-meadow cordgrass appears to spread primarily by seed. Smooth
10 cordgrass excludes the native California cordgrass. Where it invades open
11 mudflats, it may reduce available habitat for foraging shorebirds, fish, and
12 invertebrates.

13 The ecological consequences of non-native cordgrass invasion are not well
14 known, and the effectiveness of control techniques is not well documented. The
15 Conservancy is developing a separate EIR/EIS to address effects of controls, and
16 the joint state–federal CALFED program is funding studies on effects and control
17 strategies.

18 Perennial pepperweed is a widespread invasive species found in brackish to
19 alkaline/saline wetlands (Bossard et al. 2000). It forms dense stands that exclude
20 native species, including soft bird’s-beak and Suisun marsh aster, 2 special-status
21 plants that occur locally in the vicinity of North Bay marshes. Perennial
22 pepperweed spreads by seed and by pieces of the root system.

23 Stinkwort or stink aster, an invasive non-native species that colonizes disturbed
24 upland habitats and seasonal drainages, has been reported along Coyote Creek, at
25 the Alviso Marina, and at Baylands Park in Sunnyvale (Preston 1997). At the
26 marina, it occurs at the upper edges of tidal marsh. This species has only
27 recently been identified as spreading to new areas in California, and its potential
28 for displacing native species and altering habitat is not yet established.

29 Other non-native plants common in northern saltmarsh and adjacent upland
30 habitats in the San Francisco Bay region are Mediterranean saltwort, brass
31 buttons, slender-leaved iceplant, Australian saltbush, rigput brome, and rabbit’s-
32 foot grass (Baylands Ecosystem Habitat Goals 2000).

33 **Environmental Consequences and Mitigation** 34 **Measures**

35 This section describes methods used to analyze potential impacts of the
36 restoration alternatives compared to the No-Action Alternative, potential impacts
37 and impact mechanisms of each restoration alternative, and recommended
38 mitigation measures to reduce significant impacts to a less-than-significant level.

Approach and Methodology

Analytical Methods

On a landscape scale, direct impacts on existing aquatic, wetland, and grassland habitats were evaluated by comparing the quantity and quality of each type of habitat predicted to be present at the end of the 50-year evaluation period under each restoration alternative with habitat conditions under the No-Action Alternative. Fish and wildlife species that occur or have potential to occur in the expansion area were presumed to be indirectly affected by implementation of an alternative if the quantity or quality of habitats with which they are typically associated would be affected, taking into account the net changes in habitat associated with each alternative compared to the No-Action Alternative.

Direct impacts on individual species were assessed qualitatively based on the likely sensitivity or susceptibility of the species to disruption as a result of activities that may be associated with implementation of one of the restoration alternatives (e.g., noise associated with equipment operation during construction). Both short-term and long-term impacts are assessed.

It should be noted by the reader that the project impact baseline for all of the impacts discussed below consists of the existing habitats onsite and their overall value to the local and regional ecosystem. The impact assessment takes into account the amount and quality of the habitat available without the project and the amount and quality of the habitat available with the project when determining the significance of the impact and the necessity and adequacy of mitigation. The future proposed habitats are not part of the baseline for impact assessment. However, the quality of future habitats is an important consideration in project design, and measures are proposed to further project goals, such as “creating and maintaining wetland habitats that sustain viable wildlife populations.

A major assumption used in this analysis is that conditions predicted to result with implementation of the restoration alternatives would actually develop within 50 years of implementation of the proposed expansion. Predictions of future conditions are largely based on predicted rates of sediment accumulation, subsidence of dredged and other fill material, and colonization of plants, as well as predictions of the effects of wave action on plant colonization. The actual rate at which nontidal and tidal wetland habitats would evolve and their distribution on the expansion site is somewhat speculative, however, because of uncertainties regarding the actual function and interaction of these parameters in tidal systems.

Other assumptions used to conduct this analysis include the following.

- Restored habitats and supporting hydrology will have stabilized under each of the restoration alternatives within 50 years of implementation of the proposed expansion.

- 1 ■ All potential sources of surface and subsurface hazardous materials on the
- 2 expansion site will be removed or isolated before the selected restoration
- 3 alternative is implemented.
- 4 ■ All dredged material and other fill material from offsite sources used for
- 5 construction will meet the criteria and standards established by the DMMO
- 6 and other regulatory agencies with jurisdiction over the site.

7 **Impact Mechanisms**

8 The following types of activities associated with implementation of the

9 restoration alternatives could result in loss of or disturbance to aquatic, wetland,

10 and grassland habitats and associated species.

- 11 ■ Creating a staging area to provide storage of topsoil, heavy equipment, fuel
- 12 and supplies
- 13 ■ Modifying existing power towers by jacketing them in asphalt and concrete,
- 14 and driving heavy equipment to and from the towers
- 15 ■ Excavating the upper foot of topsoil and removing it to a staging area
- 16 ■ Operating equipment and other construction activity, including constructing
- 17 internal and perimeter levees and trails, grading, and excavating channels and
- 18 levee breaches
- 19 ■ Operating a hydraulic off-loader and placing the dredged material pipeline
- 20 across a portion of San Pablo Bay and in tidal coastal salt marsh
- 21 ■ Placing dredged material for restoration of wetland and upland habitat areas
- 22 (under Alternative 1 and Revised Alternative 2)
- 23 ■ Reintroducing tidal flow to currently nontidal lands
- 24 ■ Constructing a water-quality detention pond at the mouth of the excavated
- 25 main channels
- 26 ■ Installing drainage and other water-control infrastructure (under Alternative
- 27 1 and Revised Alternative 2)
- 28 ■ Performing management and maintenance activities necessary to maintain
- 29 target habitats (e.g., activities associated with control of noxious weeds),
- 30 maintain operation and integrity of infrastructure (e.g., water drainage and
- 31 control structures), and control mosquito populations
- 32 ■ Colonization of invasive non-native vegetation species that displace or
- 33 prevent establishment of native vegetation potentially lowering the habitat
- 34 value of restored wetlands
- 35 ■ Constructing, accessing, and using the Bay Trail
- 36 ■ Potentially increasing bioavailability of contaminants as a result of dredged
- 37 material placement (See the *Water Quality* section above for a discussion of

1 the potential for increased availability of contaminants due to use of dredged
2 material and due to the potential for increased mercury methylation. Because
3 this impact is covered in the *Water Quality* section, it is not discussed in this
4 section.)

5 **Thresholds of Significance**

6 The following significance criteria were used to evaluate the proposed BMKV
7 expansion. Regarding biological resources, the proposed expansion was
8 identified as resulting in a significant impact on the environment if it would
9 result in

- 10 ■ long-term degradation of a sensitive plant community because of substantial
11 alteration of land form or site conditions, including a decrease in the acreage
12 of intertidal and subtidal aquatic habitats and a decrease in the acreage or
13 quality of tidal or nontidal wetlands;
- 14 ■ substantial loss of a plant community and associated wildlife habitat,
15 including a substantial decrease in the acreage or quality of waterfowl
16 breeding or wintering habitat or a substantial decrease in the acreage or
17 quality of migrant and wintering shorebird habitat;
- 18 ■ fragmentation or isolation of wildlife habitats;
- 19 ■ substantial disturbance of wildlife resulting from human activities;
- 20 ■ avoidance by wildlife of biologically important habitat for substantial
21 periods, which may increase mortality or reduce reproductive success;
- 22 ■ disruption of natural wildlife movement corridors; or
- 23 ■ substantial reduction in local population size attributable to direct mortality
24 or habitat loss, lowered reproductive success, or habitat fragmentation of:
 - 25 □ species that are federally or state listed or proposed for listing as
26 threatened or endangered;
 - 27 □ portions of local populations that are candidates for federal or state
28 listing and federal and state species of concern; or
 - 29 □ species qualifying as rare and endangered under CEQA.

30 The following were also considered in determining whether an impact on a
31 biological resource would be considered significant:

- 32 ■ federal or state legal protection of the resource;
- 33 ■ federal, state, and local agency regulations and policies regarding the
34 resource;
- 35 ■ documented local or regional scarcity and sensitivity of the resource; and
- 36 ■ local and regional distribution and extent of the resource.

1 An alternative was considered to have a beneficial impact if it would result in a
2 substantial increase in the quantity or quality of aquatic, wetland, and grassland
3 communities or of habitat for wintering waterfowl, migrant and wintering
4 shorebirds, or special-status species.

5 **Impacts and Mitigation Measures of the No-Action** 6 **Alternative**

7 Under the No-Action Alternative, no wetland restoration would occur, and the
8 expansion site would remain in its present condition. No change in the current
9 quantity or quality of biological resources would be anticipated, and no
10 mitigation measures would be required.

11 **Impacts and Mitigation Measures Common to** 12 **Alternatives 1–3**

13 Figures 3-1, 3-5 and 3-8 (in chapter 3 of this document) illustrate the distribution,
14 50 years after implementation of the proposed expansion, of habitats restored
15 under Alternative 1, Revised Alternative 2, and Alternative 3. Table 4-7 presents
16 a comparison of the estimated extent of habitat restored under each of the
17 restoration alternatives and the expected net change in the extent of habitats
18 relative to the No-Action Alternative (i.e., existing conditions).

19 **Impact BIO-1: Increase in Subtidal Aquatic Habitat for** 20 **Resident and Anadromous Fish**

21 Subtidal aquatic habitat is expected to increase under the restoration alternatives.
22 As sediment deposition occurs, the open-water habitat created initially by
23 breaching the levees would decrease. Because dredged material would be placed
24 to raise the existing elevation of the expansion area before breaching levees
25 under Alternative 1 and Revised Alternative 2, the rate at which the extent of
26 open water decreases under those alternative is expected to be much greater than
27 under Alternative 3. Stable, vegetated channels would develop, and the habitat
28 value of open water would increase as these channels become deeper and wider.
29 These channels could be used as rearing habitat by longfin smelt and other
30 estuarine and marine fish species. The channels could also provide habitat for
31 phytoplankton, zooplankton, and benthic invertebrates, which provide important
32 food sources for fish. Juvenile chinook salmon and steelhead may temporarily
33 rear in the slough channels during their seaward migration. The increase in
34 aquatic habitat would result in a beneficial impact on resident and anadromous
35 fish.

1 **Impact BIO-2: Short-Term Loss of or Disturbance to and**
2 **Long-Term Increase in Intertidal Mudflats**

3 A small area of intertidal mudflat could be lost or disturbed near the bayside
4 termini of the excavated subtidal channels as a result of channel scour from tidal
5 flow through the channel. The loss of intertidal mudflat habitat resulting from
6 scour would be substantially offset, however, by the development of intertidal
7 mudflat habitat along the channel margins following excavation and along the
8 margins of levees following introduction of tidal flows to the restoration site.
9 Intertidal mudflats would develop between mean sea level and extreme low water
10 (figure 4-8). As sediments are deposited and the site develops, intertidal
11 mudflats would be present in varying amounts. When the wetlands are fully
12 functioning, intertidal mudflats would be limited to the slough channels and
13 along the margins of subtidal channels. The short-term loss of intertidal mudflats
14 is considered less than significant because only a small area would be disturbed,
15 and this would be replaced under each of the restoration alternatives. Intertidal
16 mudflats, however, are expected to develop more rapidly under Alternative 1 and
17 Revised Alternative 2 than under Alternative 3 because placement of dredged
18 materials will accelerate their development.

19 **Impact BIO-3: Temporary Disturbance to the Northern**
20 **Harrier, White-tailed Kite, Golden Eagle, Cooper’s Hawk,**
21 **Sharp-shinned Hawk, Short-eared Owl, Burrowing Owl,**
22 **Saltmarsh Common Yellowthroat, and San Pablo Song**
23 **Sparrow during Construction**

24 Noise, vibration, visual, and proximity-related disturbances associated with
25 construction could adversely affect the above-mentioned special-status species, if
26 they are nesting on or adjacent to the BMKV site during construction. If
27 individuals of these species nest in the expansion area during the construction
28 period, construction disturbances could cause them to abandon their nests or
29 young. The breeding success of these species could be reduced if disturbances
30 reduce the ability of adults to properly care for their eggs or young (also see
31 discussion of tree removal under Impact BIO-32). Therefore, this impact is
32 considered significant. To reduce this impact to a less-than-significant level, the
33 Conservancy, Corps, or successors in interest would implement Mitigation
34 Measure BIO-1.

35 **Mitigation Measure BIO-1: Conduct Surveys to Locate Northern**
36 **Harrier, White-tailed Kite, Golden Eagle, Cooper’s Hawk, Sharp-**
37 **shinned Hawk, Short-eared Owl, Burrowing Owl, Saltmarsh Common**
38 **Yellowthroat, and San Pablo Song Sparrow Nest Sites before**
39 **Construction Is Initiated and Avoid Breeding Sites.**

40 The Conservancy, Corps, or successors in interest will conduct surveys to locate
41 nest sites of the above-mentioned species in suitable breeding habitats in the
42 spring of each construction year. Surveys will be conducted by a qualified

1 biologist using survey methods approved by DFG. Survey results will be
2 submitted to DFG before construction is initiated. If nests or young of these
3 species are not located, construction may proceed. If nest sites or young are
4 located, the Conservancy, Corps, or successors in interest will consult with DFG
5 to determine what mitigation measures could be implemented to avoid or reduce
6 potential disturbance-related impacts on these species (e.g., establishing buffers
7 around active nest sites or sequencing construction activities to avoid activities
8 near nesting habitats during the breeding season).

9 **Impact BIO-4: Potential for Construction-Related** 10 **Mortality of Salt Marsh Harvest Mice**

11 Breaching and lowering the perimeter levee and excavating tidal channels in the
12 outboard marsh could result in direct mortality of salt marsh harvest mice, a
13 federally listed, state-listed and state fully protected species. This impact is
14 considered significant. To reduce this impact to a less-than-significant level, the
15 Conservancy, Corps, or successors in interest would implement Mitigation
16 Measure BIO-2.

17 **Mitigation Measure BIO-2: Remove Salt Marsh Harvest Mouse** 18 **Habitat and Place Barrier Fencing in the Immediate Vicinity of** 19 **Operating Equipment.**

20 The potential for construction-related mortality of salt marsh harvest mice could
21 be reduced or eliminated by hand-removal of pickleweed habitat (pickleweed in
22 tidal marshes is habitat for salt marsh harvest mice) and subsequent placement of
23 a barrier fence 20 feet from the boundaries of construction areas in and adjacent
24 to coastal salt marsh habitat. As the salt marsh harvest mouse is a fully protected
25 and listed state species and a listed federal species, the Conservancy, Corps, or
26 successors in interest will consult with USFWS and DFG to evaluate these and
27 any other appropriate methods for avoiding construction-related mortality of salt
28 marsh harvest mice.

29 **Impact BIO-5: Potential for Construction-Related** 30 **Mortality of California Clapper Rails and California Black** 31 **Rails**

32 Breaching and lowering the perimeter levee and excavating tidal channels could
33 result in direct mortality of California clapper rails and California black rails.
34 Nests with eggs or young birds could be crushed by construction equipment
35 operating in the outboard tidal marsh. This impact is considered significant
36 because expansion activities could result in the direct mortality of individuals of
37 these 2 special-status species. To reduce this impact to a less-than-significant
38 level, the Conservancy, Corps, or successors in interest would implement
39 Mitigation Measure BIO-3.

1 **Mitigation Measure BIO-3: Avoid Operation of Equipment within 250**
2 **feet of the Outboard Tidal Coastal Marsh during the Breeding Period**
3 **of the California Clapper Rail and California Black Rail.**

4 The Conservancy, Corps, or successors in interest will avoid operating
5 construction equipment in the outboard tidal marsh from February 1 to July 31.
6 A 250-foot buffer has been previously recommended in the LTMS Biological
7 Opinion and for activities that have occurred as a result of restoration activities
8 under the HWRP. This buffer is also recommended for the BMKV expansion. If
9 construction equipment must operate in the marsh during this period, surveys will
10 be conducted by a qualified biologist using survey methods approved by USFWS
11 and DFG before construction is initiated to locate clapper rail and black rails. If
12 rails are located, the Conservancy, Corps, or successors in interest will consult
13 with USFWS and DFG to determine what, if any, additional mitigation measures
14 may be required to allow construction to proceed.

15 **Impact BIO-6: Potential for Mortality of San Pablo Song**
16 **Sparrows**

17 Construction activities in tidal and nontidal marsh habitats and inundation of
18 nontidal wetlands by tidal flow could result in direct mortality of San Pablo song
19 sparrows. Nests with eggs or young birds could be crushed by construction
20 equipment or inundated or toppled by tidal flow. This impact is considered
21 significant because expansion activities could result in the mortality of
22 individuals of this special-status species. To reduce this impact to a less-than-
23 significant level, the Conservancy, Corps, or successors in interest would
24 implement Mitigation Measure BIO-4.

25 **Mitigation Measure BIO-4: Conduct Surveys to Locate San Pablo**
26 **Song Sparrow Nest Sites before Construction Is Initiated and Avoid**
27 **Breeding Sites.**

28 The Conservancy, Corps, or successors in interest will conduct surveys to locate
29 San Pablo song sparrow breeding territories in suitable marsh habitats in the
30 spring of each construction year. Surveys will be conducted by a qualified
31 biologist using survey methods approved by DFG. Survey results will be
32 submitted to DFG before construction is initiated. If active breeding territories
33 are not located, construction may proceed. If breeding territories are located, the
34 Conservancy, Corps, or successors in interest will consult with DFG to determine
35 what mitigation measures could be implemented to avoid or reduce potential
36 mortality of this species (e.g., establishing buffers around active nest sites or
37 breeding territories, or sequencing construction activities to avoid potential
38 impacts on the species during the breeding season).

39 **Impact BIO-7: Potential for Mortality of Burrowing Owls**

40 Operating equipment in grasslands west of the perimeter levee and introducing
41 tidal flow could result in direct mortality of burrowing owls. Occupied nesting

1 burrows could be crushed or buried by construction equipment or inundated as a
2 result of tidal flow. This impact is considered significant because it could result
3 in the direct mortality of individuals of this special-status species. To reduce this
4 impact to a less-than-significant level, the Conservancy, Corps, or successors in
5 interest would implement Mitigation Measure BIO-5.

6 **Mitigation Measure BIO-5: Conduct Surveys to Locate Burrowing**
7 **Owl Nest Sites before Construction Is Initiated and Avoid Breeding**
8 **Sites.**

9 The Conservancy, Corps, or successors in interest will conduct surveys to locate
10 burrowing owl nest sites in suitable grassland habitats in the spring of each
11 construction year. Surveys will be conducted by a qualified biologist using
12 survey methods approved by DFG. Survey results will be submitted to DFG
13 before construction is initiated. If active nests are not located, construction may
14 proceed, but the Conservancy, Corps, or successors in interest will consult with
15 DFG to determine what mitigation measures could be implemented to reduce
16 potential mortality of this species (e.g., establishing buffers around active nest
17 sites or sequencing construction activities to avoid potential impacts on the
18 species during the breeding season).

19 **Impact BIO-8: Potential for Construction-Related**
20 **Mortality of Outmigrating Salmonid Smolts**

21 Breaching and lowering the perimeter levee and excavating tidal channels could
22 result in direct mortality of outmigrating salmonid smolts if individuals were
23 present when construction occurred. This impact is considered significant
24 because expansion activities could result in the direct mortality of individuals of
25 special-status species. To reduce this impact to a less-than-significant level, the
26 Conservancy, Corps, or successors in interest would implement Mitigation
27 Measure BIO-6.

28 **Mitigation Measure BIO-6: Avoid Construction that Could Affect**
29 **Tidal Aquatic Habitats when Salmonid Smolts Could Be Present.**

30 The Conservancy, Corps, or successors in interest will, to the extent feasible
31 without impeding successful construction completion, avoid construction
32 activities that could affect tidal aquatic habitats (e.g., construction associated
33 with lowering the perimeter levee and excavating tidal channels through the
34 outboard salt marsh) during periods when outmigrating salmonid smolts could be
35 present. If construction activities must occur during periods these species could
36 be present, the Conservancy, Corps, or successors in interest will consult with ,
37 NMFS and DFG to determine what, if any, additional mitigation measures may
38 be required to allow construction to proceed.

1 **Impact BIO-9: Potential for Reduced Access to**
2 **Freshwater Habitat for Anadromous Salmonids**

3 Installation of culvert structures into the Pacheco Pond levee to redirect some or
4 all of the existing outlet flows into the restoration site could result in reduced
5 anadromous fish access to freshwater habitats of the tributaries to Pacheco Pond
6 (Arroyo San Jose and Pacheco Creeks). Currently, anadromous fish access to
7 Pacheco Pond and its tributaries is limited by the existing pond outlet structures.
8 Depending on the final culvert structure design chosen and decisions embodied
9 in the amended water management plan for Pacheco Pond concerning outlet
10 flow, anadromous fish access to Pacheco Pond and its tributaries could be
11 reduced or eliminated.

12 There do not appear to be any self-sustaining runs of anadromous salmonids in
13 Pacheco Pond and its tributaries (National Marine Fisheries Service 1998). The
14 recently reported sighting (December 2001) of 3 adult chinook salmon in Arroyo
15 San Jose Creek are most likely fall-run strays of hatchery origin based on the
16 watershed in question (San Pablo Bay tributary), timing of occurrence
17 (December), and known distributions (habitat elevation below 450 meters). Fall-
18 run chinook salmon are a candidate species, and the latest status review did not
19 indicate that the run warrants listing. Because these do not appear to be self-
20 sustaining runs and do not appear to include listed species, this impact is
21 considered less-than-significant. However, since one of the purposes of Pacheco
22 Pond management is wildlife habitat conservation, potential fish passage should
23 be considered when developing the amended water management plan for
24 Pacheco Pond.

25 **Impact BIO-10: Potential Disturbance to or Mortality of**
26 **Special-Status Species Resulting from Monitoring and**
27 **Adaptive Management Activities**

28 Monitoring and adaptive management activities, such as mosquito abatement,
29 water-control structure and levee maintenance, and control of noxious weeds,
30 could be required to ensure restoration success. These activities could result in
31 disturbance to or mortality of special-status species if special-status species
32 occupy restored habitats. This impact is considered significant. To reduce this
33 impact to a less-than-significant level, the Conservancy, Corps, or successors in
34 interest would implement Mitigation Measure BIO-7.

35 **Mitigation Measure BIO-7: Develop and Implement a Restoration**
36 **Monitoring and Adaptive Management Program Designed to**
37 **Minimize Potential Impacts on Special-Status Species.**

38 The Conservancy, Corps, or successors in interest will develop a restoration
39 monitoring and adaptive management program, in coordination with USFWS,
40 NMFS and DFG, within 1 year after the completion of construction. Important
41 elements of the program will be scheduling intrusive activities to avoid periods

1 when special-status species are sensitive to disturbance and implementing
2 management practices that have minimal effects on special-status species, to the
3 greatest extent feasible.

4 **Impact BIO-11: Loss of Refugia for the California Clapper** 5 **Rail, California Black Rail, and Salt Marsh Harvest Mouse**

6 Lowering portions of the perimeter levee to elevations approximating that of
7 mean higher high water would result in the loss of suitable refugia for the
8 California clapper rail, California black rail, and salt marsh harvest mouse when
9 the outboard marsh is inundated during high tides. With implementation of the
10 project, refugia would be provided by transitional and upland habitat areas
11 restored at the upper elevations of restored tidal marshes. These habitat areas
12 would be accessible to rails but could be too distant from the existing outboard
13 marsh to be used by salt marsh harvest mice. Some portions of the lowered
14 outboard perimeter levee, however, would be left at higher elevations that would
15 not be inundated by tides and, would therefore continue to provide flood refugia
16 for mice and rails. Therefore, this impact is considered less than significant and
17 no mitigation is required.

18 **Impact BIO-12: Increase in Suitable Habitat for the Brown** 19 **Pelican and Double-crested Cormorant**

20 Breaching the perimeter levee and introducing tidal flow to the expansion site
21 east of the cross panhandle levee would initially create a large body of open
22 water, which would provide suitable resting habitat for the brown pelican and
23 double-crested cormorant. If tidal flows into the marsh were sufficient to entrain
24 substantial numbers of fish and other prey items, open water areas would also
25 provide suitable foraging habitat for these species. The area of suitable habitat
26 for these species would decrease, however, as the expansion site aggrades with
27 sedimentation and vegetation becomes established. Because placement of
28 dredged material under Alternative 1 and Revised Alternative 2 is expected to
29 increase the rate at which tidal coastal salt marsh develops, suitable habitat area
30 for these species would decrease more rapidly under these alternatives than under
31 Alternative 3. At maturity, subtidal channels would continue to provide suitable
32 habitat for these species. Additionally, expansion of Pacheco Pond as proposed
33 under the restoration alternatives would provide an increase in foraging and
34 resting areas that may be utilized by these species. This impact overall is
35 considered beneficial.

Impact BIO-13: Increase in Suitable Nesting Habitat for Resident Waterfowl

Development of undisturbed grassland, seasonal wetland, and tidal coastal marsh vegetation, all of which are expected to increase under each of the restoration alternatives (see table 4-7), would substantially increase the area of suitable waterfowl nesting habitat. This impact is considered beneficial.

Impact BIO-14: Loss of Coastal Salt Marsh

Excavation of subtidal channels through the tidal marsh would result in the direct loss of a small amount of high-, middle-, and low-tidal coastal salt marsh during excavation of levee breaches (estimated at 1 to 3 acres each). Increased scour of the lower Novato Creek channel due to an increase in tidal flows in the creek in Alternatives 1 and 2 only, would also result in loss of an estimated 2 to 5 acres of coastal salt marsh. Due to placement of dredge material and/or natural sedimentation approximately 21 acres of nontidal coastal salt marsh would be converted to tidal coastal salt marsh.

As a result of implementation of the proposed BMKV expansion, tidal marsh vegetation is expected to gradually colonize the newly established mudflats between the elevations of extreme spring high tide and mean sea level. Sites at these elevations could be colonized by tidal marsh vegetation following introduction of tidal flows, including portions of the lowered bayward levee, margins of the internal peninsulas, and perimeter levees. In the early years of the expansion, vegetation would most likely establish in locations sheltered from waves. The acreage suitable for establishing tidal coastal salt marsh (the zone between extreme high tide and mean sea level) is expected to increase as a result of sediment deposition. In addition, as the site aggrades and the extent of vegetated area increases, the effects of wave action on the ability of vegetation to establish would be reduced because established vegetation would attenuate wave energy across the site.

The loss of tidal and nontidal coastal salt marsh habitat is expected to be offset by tidal coastal salt marsh habitat that would develop on the site at a greater than 2:1 in-kind replacement ratio within 10 years following implementation of the proposed expansion. At maturity, an estimated 1,039, 899 and 1,274 acres of tidal coastal salt marsh would be restored under Alternative 1, Revised Alternative 2, and Alternative 3, respectively (see table 4-7). Establishment of tidal coastal salt marsh habitat would take longer under Alternative 3 than under the other alternatives due to the time it takes natural sedimentation to result in marsh plain elevations. If coastal salt marsh habitat developed as designed, the net increase in this habitat type would be a beneficial impact. Because of uncertainties regarding the rate of sedimentation and the associated rate of establishment of native salt marsh vegetation, however, there could be a time lag between the physical construction of the restoration site and establishment of new salt marsh habitat. Therefore, this temporal reduction in the amount of salt

1 marsh habitat is considered a significant impact. To reduce this impact to a less-
2 than-significant level, the Conservancy, Corps, or successors in interest would
3 implement Mitigation Measure BIO-8.

4 **Mitigation Measure BIO-8: Monitor Site Development and Implement**
5 **Actions to Increase the Rate of Marsh Development, If Required.**

6 The Corps, in conjunction with the Conservancy or its successors in interest, will
7 develop and implement a monitoring and adaptive management program to
8 measure the rate of tidal coastal salt marsh establishment and the quantity and
9 quality of established coastal salt marsh. Restored coastal salt marsh will be
10 monitored annually for the first 5 years, and again in years 10 and 15 following
11 breaching of the outboard levees. The Corps and Conservancy (or its successor)
12 would be responsible for the first 5 years of monitoring and the monitoring in
13 year 10. The Conservancy (or its successor) would be responsible for monitoring
14 in year 15, because it is beyond the 13-year Corps monitoring period. The
15 monitoring program will be designed to determine whether coastal tidal marsh is
16 developing and whether its primary supporting physical processes (i.e., tidal
17 exchange and sedimentation) are occurring at the estimated rate during the first
18 15 years following completion of construction. Subsequent inspection and
19 surveillance of tidal salt marsh development at year 15 and beyond will be the
20 responsibility of the non-Federal Sponsor in connection with its obligation for
21 operating, maintaining, repairing, rehabilitating, and replacing the project.
22 Because it will occur beyond the 13-year Project monitoring period, the
23 Conservancy will independently assume (including on behalf of any successors)
24 the responsibility for monitoring in year 15, in addition to its obligation to
25 conduct inspection and surveillance of the project.

26 Major elements of the monitoring program will include the following.

- 27 ■ Measure the extent of tidal coastal salt marsh removed to determine the
28 amount of tidal coastal salt marsh that would need to be restored to
29 compensate for loss of tidal coastal salt marsh at an in-kind replacement ratio
30 of 2 acres restored for every acre of tidal salt marsh removed.
- 31 ■ Monitor parameters, including tidal stage, tidal current, wind speed and
32 direction, wave characteristics, suspended sediment concentrations,
33 sedimentation rates and distribution, marsh elevations, mudflat elevations,
34 areal extent and locations of established or colonizing salt marsh vegetation,
35 composition and density of established and colonizing plant species,
36 characteristics of subtidal channel and marsh surface sediments, and San
37 Pablo Bay shoreline characteristics.
- 38 ■ Monitor locations, including the tidal wetland interior, tidal wetland
39 perimeter, subtidal channels, and existing San Pablo Bay marsh shoreline.
- 40 ■ Compare predicted and measured site development and function.
- 41 ■ Analyze monitoring data to identify possible reasons for differences between
42 observed and predicted conditions.

- 1 ■ Recommend remedial actions that could be implemented if the restoration is
2 not proceeding as designed.

3 Monitoring reports will be submitted by the Conservancy, Corps, or successors in
4 interest to the DFG, USFWS, NMFS, and BCDC for each year in which
5 monitoring of the development of coastal tidal salt marsh is conducted.

6 At the end of the initial 5-year monitoring period, if the development rate of the
7 coastal salt marsh and the habitat quality of establishing coastal salt marsh do not
8 appear to conform to the goals and projections established for the project or
9 sufficient to replace each acre of removed tidal coastal salt marsh with 2 acres of
10 contiguous, in-kind habitat within 10 years of levee breach, the Corps, in
11 conjunction with the Conservancy, or its successors in interest will review the
12 proposed BMKV expansion with representatives of DFG, USFWS, and NMFS to
13 determine whether additional monitoring, adaptive management actions, or
14 modifications are necessary to ensure that the functions and values of the affected
15 coastal salt marsh habitat will be replaced. The Corps, in conjunction with the
16 Conservancy or its successors in interest, may initiate a similar review of marsh
17 development following completion of monitoring in year 10 if the Corps or
18 Conservancy concludes that additional actions or modifications are necessary to
19 meet restoration goals. The Conservancy or its successors in interest may initiate
20 a similar review of marsh development following completion of monitoring in
21 year 15 if they conclude that additional actions or modifications are necessary to
22 meet restoration goals.

23 Monitoring of morphologic evolution will allow the Corps, in conjunction with
24 the Conservancy or its successors in interest, to assess the success of habitat
25 development and make decisions regarding corrective measures if necessary.
26 Potential corrective measures include changing the breach and subtidal channel
27 dimensions, altering perimeter levee berm morphology, and modifying channel
28 characteristics within the restored tidal wetlands to ensure adequate morphologic
29 evolution.

30 **Impact BIO-15: Loss of Brackish Open Water Habitat and** 31 **Brackish Marsh**

32 Establishing tidal exchange at the expansion site would result in the direct loss of
33 brackish open water habitat associated with Borrow Pit A and the drainage
34 ditches, as well as the loss of brackish marsh vegetation on the edge of the
35 drainage ditches. With diversion of some or all of the existing Pacheco Pond
36 outlet flow to the restoration site, there is also a potential for siltation of the pond
37 outlet channel between Bel Marin Keys Boulevard and Novato Creek, which
38 could result in loss of brackish open water and emergent habitat that may be
39 present along the edge of the channel. However, with the dual operation that is
40 expected to be an outcome of the new water management plan, siltation may be
41 averted. The loss of brackish open water habitat would be offset by the creation
42 of a 40-acre expanded Pacheco Pond and 10 acres of emergent marsh around the

1 expanded pond under Alternatives 1 and 3 and by a 21-acre expanded pond, 12
2 acres of emergent marsh, and 277 acres of seasonal wetlands under Revised
3 Alternative 2.

4 Because of uncertainties regarding the development of subsurface and surface
5 hydrology and the associated quantity of brackish open water and emergent
6 marsh vegetation (all alternatives) or seasonal wetlands (Revised Alternative 2)
7 habitats of sufficient quality and quantity may not establish rapidly enough to
8 offset impacts that occur during construction and inundation of the restoration
9 site. To reduce this impact to a less-than-significant level, the Conservancy,
10 Corps, or successors in interest would implement Mitigation Measure BIO-9.

11 **Mitigation Measure BIO-9: Monitor Development of Brackish Open**
12 **Water, Emergent Marsh, and/or Seasonal Wetlands.**

13 The Corps, in conjunction with the Conservancy, or its successors in interest, will
14 develop and implement a 5-year monitoring program to measure the
15 establishment rate, quantity, and quality of brackish open water, emergent marsh,
16 and/or seasonal wetlands.

17 Major elements of the monitoring program will include the following.

- 18 ■ Measure areal extent and locations of established or colonizing marsh
19 vegetation.
- 20 ■ Measure composition and density of established and colonizing plant species.
- 21 ■ Compare predicted and measured site development and function.
- 22 ■ Analyze monitoring data to identify possible reasons for differences between
23 observed and predicted conditions.
- 24 ■ Recommend remedial actions that can be implemented if the restoration is
25 not proceeding as designed.

26 Monitoring reports will be submitted by the Corps, Conservancy, or its
27 successors in interest, to DFG, USFWS, NMFS, and BCDC for each year in
28 which monitoring of the development of seasonal wetland and emergent marsh
29 areas is conducted. If the rate, quality, and quantity of created habitat are not
30 meeting restoration goals at the end of the 5-year period, the sponsoring agencies
31 will consult with DFG, USFWS, NMFS, and technical experts regarding further
32 monitoring and potential corrective actions.

33 **Impact BIO-16: Loss of Seasonal Wetlands**

34 Creating tidal exchange at the expansion site and constructing the internal levees
35 would result in the loss of seasonal wetland habitat, totaling approximately 114
36 acres (see table 4-7). These areas occur as inclusions within highly disturbed
37 non-native annual grassland. Because of their size, location, and level of
38 disturbance, the wetlands provide few of the functions and values of higher

1 quality seasonal wetlands. Under Alternative 1, approximately 40 acres of
2 seasonal wetland would be restored in the swale area. Under Revised Alternative
3 2, approximately 277 acres of seasonal wetland would be restored in the swale
4 south of the BMK south lagoon and adjacent to Pacheco Pond. Under
5 Alternative 3, approximately 10 acres of seasonal wetland would be restored.
6 The loss of seasonal wetlands is considered less than significant because of the
7 relative value of the wetlands and because the loss would be offset by the
8 establishment of in-kind seasonal wetlands elsewhere on the expansion site that
9 are expected to be of substantially higher habitat quality than the present seasonal
10 wetlands as well as substantially greater acreage of out-of-kind tidal wetlands.

11 **Impact BIO-17: Loss of Agricultural Wetlands**

12 Creating tidal exchange at the expansion site and constructing the internal levees
13 would result in the loss of agricultural ponding habitat totaling approximately
14 151 acres, based on the ponding analysis conducted as part of the wetland
15 delineation (see table 4-7). Because of their size, location, and level of
16 disturbance, the wetlands provide few of the functions and values of higher
17 quality seasonal or other wetlands. Under Alternative 1, approximately 40 acres
18 of seasonal wetlands, 40 acres of open-water habitat, 10 acres of emergent marsh
19 around the expanded Pacheco Pond, and substantial amounts of tidal wetlands
20 would be restored (see table 4-7). Under Revised Alternative 2, approximately
21 277 acres of seasonal wetland, 21 acres of open-water habitat, 12 acres of
22 emergent marsh, and substantial amounts of tidal wetlands would be restored.
23 Under Alternative 3, approximately 10 acres of seasonal wetlands, 40 acres of
24 open-water habitat, 10 acres of emergent marsh around the expanded Pacheco
25 Pond, and substantial amounts of tidal wetlands would be restored. The loss of
26 agricultural wetlands is considered less than significant because of the relative
27 value of the wetlands and because the loss would be offset by the establishment
28 of both in-kind and out-of-kind replacement wetlands expected to be of higher
29 quality.

30 **Impact BIO-18: Loss of Grassland at BMKV Site**

31 Constructing expansion levees, breaching levees, restoring wetlands, and
32 inundation and other features of the restoration would result in the direct loss of
33 approximately 129 acres of grassland habitat. Loss of grasslands would reduce
34 the available habitat area for raptors, western meadowlarks, Brewer's blackbirds,
35 and other regionally abundant songbirds.

36 The loss of grassland habitat would be offset by the creation of an estimated 300,
37 247, and 45 acres of higher quality grasslands near restored seasonal wetlands
38 under Alternative 1, Revised Alternative 2, and 3, respectively (see table 4-7).
39 These grassland areas would provide nesting cover for waterfowl and other
40 ground-nesting species, and refugia for small mammals, reptiles, and other
41 wildlife. Restored grassland would be seeded with desirable grasses and forbs

1 that would generally provide higher forage and cover values for wildlife than the
2 grassland affected by the proposed BMKV expansion. The short-term impact
3 associated with the loss of grassland is considered less than significant because
4 grassland is regionally abundant, and the short-term loss of grassland habitat is
5 expected to have little or no effect on regional populations of grassland-
6 associated wildlife.

7 **Impact BIO-19: Loss of Habitat for California Clapper**
8 **Rail, California Black Rail, Salt Marsh Harvest Mouse, and**
9 **Salt Marsh Common Yellowthroat**

10 The California clapper rail, California black rail, salt marsh harvest mouse, and
11 salt marsh common yellowthroat are dependent on salt marsh habitats. As
12 described in Impact BIO-14, tidal coastal salt marsh would be lost as a result of
13 construction of the proposed expansion restoration features in the tidal marsh. If
14 restoration performs as predicted, suitable habitat for these species could be
15 increased by approximately 1,021 acres under Alternative 1, approximately 882
16 acres under Revised Alternative 2, and approximately 1,256 acres under
17 Alternative 3. Establishment of tidal marsh would take longer under Alternative
18 3 than under the other alternatives. However, because of uncertainties regarding
19 the development of new marshes, this analysis must assume that the quality, type,
20 and minimum habitat patch size required by these species may not develop (as
21 described under Impact BIO-14). Therefore, this impact is considered
22 significant. To reduce this impact to a less-than-significant level, the
23 Conservancy, Corps, or successors in interest would implement Mitigation
24 Measure BIO-8.

25 **Impact BIO-20: Temporary Loss of Nesting Habitat for**
26 **San Pablo Song Sparrow**

27 Coastal salt marsh and brackish marsh support suitable nesting habitat for the San
28 Pablo song sparrow. Limited amounts of tidal coastal salt marsh would be lost
29 due to levee breaching and Novato Creek channel scour as discussed above under
30 impact BIO-14. Implementation of wetland restoration could also result in
31 removal of up to approximately 21 acres of nontidal coastal salt marsh and
32 limited amounts of brackish marsh vegetation in the drainage ditches. If
33 restoration performs as predicted, the extent of suitable species habitat could be
34 increased by approximately 900 to more than 1,000 acres under the restoration
35 alternatives (see table 4-7). Establishment of tidal coastal salt marsh habitat
36 would take longer under Alternative 3 than under the other alternatives.
37 However, because of uncertainties regarding development of the new marshes,
38 this analysis assumes that the quality, type, and minimum habitat patch size
39 required by this species may not develop (as described under Impacts BIO-14
40 and BIO-15). Therefore, this impact is considered significant. To reduce this

1 impact to a less-than-significant level, the Conservancy, Corps, or successors in
2 interest would implement Mitigation Measures BIO-8 and BIO-9.

3 **Impact BIO-21: Temporary Loss of Nesting and/or**
4 **Foraging Habitat for Northern Harrier, White-tailed Kite,**
5 **and Short-eared Owl**

6 Construction activities associated with levee and seasonal wetland construction
7 and inundation of approximately 129 acres of grassland habitat and 1,241 acres
8 of agricultural lands by tidal flow would result in the permanent loss of suitable
9 northern harrier, white-tailed kite, and short-eared owl nesting and/or foraging
10 habitat. The loss of nesting and/or foraging habitat would be offset by the
11 creation of 300 acres of upland and approximately 1,039 acres of tidal coastal salt
12 marsh habitat under Alternative 1, approximately 247 acres of grassland and 899
13 acres of tidal coastal marsh habitat under Revised Alternative 2, and
14 approximately 45 acres of grassland and 1,274 acres of tidal coastal salt marsh
15 under Alternative 3 (table 4-7). This impact is considered less-than-significant,
16 and mitigation is not required.

17 **Impact BIO-22: Loss of Foraging Habitat for Golden Eagle**
18 **and Burrowing Owl**

19 Construction activities associated with levee and seasonal wetland construction
20 and inundation by tidal flow of approximately 129 acres of grassland habitat and
21 1,241 acres of agricultural lands would result in the permanent loss of suitable
22 golden eagle and burrowing owl foraging habitat. This loss of foraging habitat
23 would be partially offset by restoration of 300, 247, and 45 acres of upland
24 habitat under Alternative 1, Revised Alternative 2, and Alternative 3,
25 respectively (table 4-7). This impact is considered less than significant because
26 the loss of golden eagle and burrowing owl foraging habitat represents a small
27 fraction of the available foraging habitat for these species in the region.

28 **Impact BIO-23: Temporary Loss of Foraging Habitat for**
29 **Wintering Waterfowl**

30 Approximately 1,241 acres of agricultural land that provides foraging habitat for
31 wintering waterfowl would be lost as a result of implementing Alternative 1,
32 Revised Alternative 2, or Alternative 3 (see table 4-7). Lost agricultural foraging
33 habitat, however, would be replaced by restored grassland, seasonal wetland,
34 brackish marsh, and coastal tidal marsh habitats under each of the alternative.
35 These restored habitats are expected to support suitable foraging and resting
36 habitat for migrating and wintering waterfowl. Because most of the expansion
37 area would not be accessible for recreation or other public uses, the expansion
38 area could serve as an important resting area during the waterfowl hunting

1 season. The quality and quantity of suitable foraging and resting habitat would
2 change over time (e.g., the area of open water and mudflat would be reduced as
3 areas of restored tidal marsh aggrade and become vegetated). This impact is
4 considered less than significant.

5 **Impact BIO-24: Increase in Suitable Habitat for Migratory** 6 **Shorebirds**

7 Mudflats and shallow water (less than 6 inches deep) are important foraging and
8 resting habitat areas for shorebirds that migrate through and winter in coastal and
9 central California. Breaching the outboard levee and introducing tidal flow to the
10 expansion area under the restoration alternatives would initially create areas of
11 tidal mudflat around the edges of and along channels in the tidal marsh
12 restoration area. Under Alternative 3, the extent of tidal mudflat over the 5-year
13 evaluation period would be greater than under the other alternatives because tidal
14 coastal salt marsh vegetation would require longer to establish. Tidal mudflats
15 are expected to support large numbers of benthic organisms that are prey for
16 shorebirds. As the site experienced aggradation but before large portions of the
17 tidal marsh became vegetated, the area of tidal mudflat would increase; as the site
18 continued to mature, tidal mudflats would primarily be limited to slough channels
19 and along the margins of subtidal channels. This impact is considered beneficial.

20 **Impact BIO-25: Potential for Spread of Invasive Non-** 21 **Native Plants within and outside of Restoration Area** 22 **during Construction Activities**

23 Construction activities, including onsite grading in preparation for placement of
24 dredged material, and use of dredged material from areas of the Bay could result
25 in the spread of non-native invasive plant species that are problematic in the San
26 Francisco Bay region. Of particular concern are several species of cordgrass,
27 perennial pepperweed, and stinkwort.

28 Grading and use of dredged material could result in the spread of non-native
29 cordgrasses, including smooth or salt-water cordgrass, common cordgrass, a
30 fertile hybrid between smooth cordgrass and a British cordgrass, dense-flowered
31 cordgrass, and salt-meadow cordgrass.

32 Smooth cordgrass is of highest concern because of its prevalence and its ability
33 to alter native northern saltmarsh habitat, colonize tidal mudflats, and reduce the
34 open water and capacity of channels (Bossard et al. 2000, Cohen and Carlton
35 1998, Callaway and Josselyn 1992).

36 Perennial pepperweed has been observed along Novato Creek near the BMKV
37 site. Presence of this species may inhibit the establishment of native vegetation
38 in floodplain areas adjacent to tidal channels. Tires and equipment could spread

1 this species to uninfested areas in the course of construction and grading
2 activities.

3 Stinkwort is currently known from the South Bay and is likely to be restricted to
4 levee banks and upland areas, and is consequently not expected to affect tidal
5 habitats. It has the potential, however, to be a serious pest species and should be
6 monitored.

7 Mediterranean saltwort, brass buttons, slender-leaved iceplant, Australian
8 saltbush, riggut brome, rabbit's-foot grass, and other invasive non-native plants
9 have the potential to prevent establishment of native plants in and near areas
10 where restoration activities are undertaken.

11 The potential for the spread of invasive non-native plants during construction
12 could reduce the quality and function of the resulting marsh habitats.
13 Furthermore, establishment of one or more of these species could create source
14 populations that could subsequently invade other areas and potentially reduce the
15 success of other tidal marsh restoration efforts. Implementation of the two
16 mitigation measures described below could substantially mitigate this effect.

17 **Mitigation Measure 10a: Prevent Spread of Perennial Pepperweed**
18 **and Other Invasive Weeds to Uninfested Areas.**

19 A qualified botanist will conduct a non-native plant assessment of areas subject
20 to construction activities and will recommend specific measures to control spread
21 of non-native species. Measures may include the establishment of wash stations
22 for construction vehicles and equipment to clean tires of weed seeds and other
23 propagules before they are moved offsite, and the development of an herbicide
24 spray program to destroy perennial pepperweed or other invasive weed
25 infestations prior to construction.

26 **Mitigation Measure 10b: Monitor Restoration Sites for and Control**
27 **Infestation by Invasive Non-Native Plants.**

28 After being planted, restoration areas will be monitored for infestation of non-
29 native cordgrasses, perennial pepperweed, stinkwort, and other potentially
30 invasive species. All infestations occurring within wetland habitats will be
31 controlled and removed to the extent feasible without jeopardizing the
32 establishment of surrounding native vegetation. A long-term monitoring plan
33 will be developed, subject to review and approval by USFWS and DFG, that will
34 remain in effect until marsh habitat is established.

35 **Impact BIO-26: Biological Benefit from Increases in**
36 **Organic Carbon and Nitrogen Concentrations**

37 As stated in the San Francisco Bay Area Wetlands Ecosystem Goals Project
38 (1999) study, the biological productivity of the Bay has been diminished due to
39 the lack of salt marsh habitats. Biological productivity or potential biological
40 productivity can be measured by the organic carbon and nitrogen concentrations

1 present in a marsh system. Under the proposed BMKV expansion, restoring or
2 creating salt marsh habitat (i.e., sub-tidal and tidal habitat) provides the increased
3 area where mineral nutrients such as nitrate and orthophosphate and atmospheric
4 carbon are converted to organic forms through the nitrogen and carbon cycle.
5 Organic carbon and nitrogen are the primary building blocks for lower trophic-
6 level organisms, which provide food for higher-level organisms. This potential
7 for an increase in productivity is considered a biological benefit.

8 **Impact BIO-27: Disruption of Sensitive Wildlife due to** 9 **Bay Trail Construction, All Alternatives**

10 All of the alternatives include extending the Bay Trail along the southwest
11 perimeter of the HWRP and northward from the City of Novato levee to Pacheco
12 Pond. The impacts of Bay Trail construction along the trail areas common to all
13 alternatives are discussed in this section. Impacts unique to each alternative are
14 discussed separately below.

15 The 2 areas common to all alternatives are (1) the southwestern perimeter of the
16 HWRP, where the trail would be extended from the Hamilton residential area
17 along existing roads and levees to a point approximately 700 feet from the
18 outboard levee; and (2) the area west of the HWRP and north of the City of
19 Novato levee trail, where the Bay Trail would be routed on the new levee to be
20 built along the northwestern edge of the HWRP to Pacheco Pond. Figure 4-10
21 shows the Bay Trail segments that are common to all alternatives. The EIS/EIR
22 for the authorized HWRP analyzed the effects of construction of levees and
23 wetland restoration adjacent to these areas, but did not include a Bay Trail at the
24 areas proposed in this document.

25 Levees would be built as part of the HWRP along the existing southern perimeter
26 of the HAAF parcel and northward from the City of Novato levee to Pacheco
27 Pond. No levee is proposed in the area between the southern perimeter levee and
28 the pump station near the baseball field and residential area.

29 The southward extension of the Bay Trail would be on the existing paved and
30 concrete areas south of the pump station until the perimeter levee is reached. The
31 perimeter levee would be improved as part of the HWRP because it would be
32 adjacent to the HWRP tidal wetland area. Construction of the levee was
33 analyzed in the prior EIS/EIR and is not reanalyzed here. Construction of the
34 Bay Trail on the levee as part of completion of the levee is not expected to result
35 in any additional impact on sensitive wildlife.

36 The northward extension of the Bay Trail would be along the levee to be
37 constructed from the City of Novato levee to Pacheco Pond. Because the trail
38 would be constructed along the new levee, there would be little to no impact to
39 sensitive wildlife or habitat outside of that already analyzed in the 1998 EIR/EIS.
40 Because there are grasslands just west of the proposed levee and trail location,
41 the indirect impact to the grasslands would be similar to Impact BIO-3 described

1 above, and Mitigation Measure BIO-1 should be implemented to reduce this
2 impact to less than significant.

3 **Impact BIO-28: Disruption of Sensitive Wildlife due to** 4 **Public Access Interactions along the Bay Trail**

5 All of the alternatives include extending the Bay Trail along the southwest
6 perimeter of the HWRP and northward from the City of Novato levee to Pacheco
7 Pond. Each alternative includes a unique route for the Bay Trail from the south
8 side of Pacheco Pond to Bel Marin Keys Boulevard. In addition, Alternatives 1
9 and 3 include a spur option to extend a trail to Novato Creek through BMKV.
10 Each alternative has the potential for disruption of sensitive wildlife by public
11 access in proximity to sensitive wetland habitat that exists at present in and
12 around Pacheco Pond. Alternatives 1 and 3 spur options could also result in
13 access-related disturbance to existing sensitive habitat in Novato Creek. In
14 addition, future public access would be adjacent to wetland areas created as part
15 of the restoration project, which is a concern in achieving the project objective of
16 “creating and maintaining wetland habitats that sustain viable wildlife
17 populations.” However, as noted in the discussion above, impacts to future
18 habitats are assessed in the context of the habitats present today and the net
19 changes that result from each alternative.

20 The specifics of each Bay Trail or spur option route and its potential construction
21 and access impacts are discussed later in this section under impacts unique to
22 each alternative. The following discussion presents information about the
23 general nature of potential access-related impacts for all 3 restoration
24 alternatives.

25 In 1996 independent scientific consultants to the Bay Trail Project undertook an
26 extensive literature search for material that addressed public-trail-related impacts
27 on wildlife, in preparation for a scientific field study (Sokale and Trulio 1996).
28 Out of hundreds of abstracts that were reviewed by consultants to the Bay Trail
29 Project, only 25 were found that specifically addressed the topic of human-
30 disturbance impacts on wildlife. Moreover, only 8 of those 25 were field studies
31 that directly assessed impacts of trail-related activity on wildlife. The
32 conclusions drawn from these studies were varied, though the 8 field studies all
33 showed some adverse impact on wildlife from trail activity (San Francisco Bay
34 Conservation and Development Commission 2001).

35 The most common responses reported were animals moving away in response to
36 human activity, and changes in species diversity and abundance near trails. Six
37 of the studies reported immediate effects on animal behavior, such as moving
38 away from the trail when users approached the study site. Only 1 study was done
39 in the San Francisco Bay Area. That study looked at the amount of human
40 disturbance at 4 wetland sites and found that, as human disturbance at a site
41 increased, the number of birds decreased. The study did not compare the study

1 sites to control sites (San Francisco Bay Conservation and Development
2 Commission 2001).

3 The San Francisco Bay Trail Project is currently conducting a scientific study of
4 the potential effects of non-motorized recreational trails on shorebirds and
5 waterfowl that use mudflat foraging habitat adjacent to the San Francisco Bay
6 Trail. The study is being conducted at 3 sites in the Bay Area and includes trail
7 and control sites. The study examines impacts to birds in their foraging habitat.
8 Potential effects of trail use on species abundance and diversity adjacent to
9 breeding habitat are not a part of the study. Preliminary findings based on early
10 analyses showed no general relationship between human use of trails and bird
11 abundance or diversity in foraging habitats at the 3 locations studied in the San
12 Francisco Bay Area (San Francisco Bay Conservation and Development
13 Commission 2001).

14 There are presently many unknowns surrounding the possible effects of public
15 access on wildlife. The initial results of the 2 studies noted above in the San
16 Francisco Bay area are varied.

17 BCDC prepared a draft report in 2001 that reviews Bay Plan access policies and
18 existing scientific understanding of access/wildlife interactions, and provides
19 guidance concerning design of public access for enhancing wildlife
20 compatibility. Key conclusions of the report include the following.

21 “There is evidence that public access may have adverse effects on wildlife.
22 Adverse effects on wildlife from human activities may be both direct (such as
23 harassment or harvest) and indirect (such as habitat modification), and effects
24 can be both immediate and long term. Immediate effects may include: nest
25 abandonment (which may increase risk of predation of eggs or young); flushing;
26 and increased stress, which can lead to reduced feeding or site abandonment.
27 Long-term effects may include decreased reproductive success, decreased
28 population within species, or decreased number of total species. If improperly
29 sited, public access may fragment habitats and serve as predator access routes to
30 wildlife areas.”

31 “Potential adverse effects from public access can be addressed through the
32 employment of siting, design, and management strategies to avoid or minimize
33 adverse effects, including such strategies as use restrictions, buffers, periodic
34 closures or the prohibition of public access in specific areas. Siting, design and
35 management strategies can be effective in avoiding or reducing adverse effects
36 on wildlife.”

37 “There is a need for more, well-designed, scientific studies of effects of human
38 activities on wildlife, both on a local scale in the San Francisco Bay Area, and
39 on a national scale in similar habitats with similar recreational uses.”

40 BCDC also reviewed the potential benefits of various siting, design, and
41 management strategies that may be used to avoid or minimize adverse effects of
42 public access on wildlife. These possible strategies include the following (San
43 Francisco Bay Conservation and Development Commission 2001).

- 1 ■ Durable Materials—Construction of durable pathways can reduce erosion and
- 2 limit creation of alternative access routes that may be unsafe or muddy.
- 3 ■ Varied Access Experiences—Varied and interesting access experience can
- 4 keep users in designated areas and limit creation of informal routes.
- 5 ■ Spur Trails/Point Access—Limit physical access to sensitive areas while
- 6 providing users with some access.
- 7 ■ Parking/Staging Access—Location away from sensitive areas can reduce use
- 8 levels within 0.25 to 0.5 mile from staging areas.
- 9 ■ Buffers and Barriers—Use of vegetation, open space, and fences can provide
- 10 physical, visual, and/or sound barriers between users and sensitive wildlife.
- 11 ■ Boardwalks/Bridges—Confine access to designated areas while allowing
- 12 hydrologic connections to be maintained.
- 13 ■ Overlook Points—Provide for visual access while limiting direct
- 14 contact/proximity.
- 15 ■ Seasonal/Periodic Closures—Reduce potential interactions during breeding or
- 16 other sensitive wildlife periods.
- 17 ■ Use Restrictions—Control adverse effects of dog access, wildlife feeding,
- 18 fishing, motorized vehicles, etc.

19 Although the specific design features for the Bay Trail or spurs to the Bay Trail
20 have not been selected, the potential for access/wildlife impacts is considered a
21 significant impact under all 3 alternatives because of the proximity of existing
22 sensitive habitats and wildlife. The specifics of the potential impacts of each
23 alternative route are discussed later in this section. Regardless of the route
24 selected, Mitigation Measure BIO-11 would be implemented by the
25 Conservancy, Corps, or successors in interest to reduce this impact. In the
26 context of the substantial increases in wetland habitat resulting from the project
27 and with implementation of this measure and the route-specific mitigation
28 measures, the impact of access on sensitive wildlife would be less than
29 significant.

30 **Mitigation Measure BIO-11: Incorporate Wildlife-Sensitive**
31 **Approaches in Bay Trail Design and Develop Trail Management**
32 **Plan.**

33 The Conservancy, Corps, or successors in interest will develop the final design
34 for any proposed Bay Trail routes or spur trail options in coordination with
35 BCDC, DFG, USFWS, the County of Marin, the City of Novato, and the Bay
36 Trail project. The specific trail design will include consideration of at least the
37 following strategies (described above in the impact discussion), as appropriate to
38 reduce access conflicts.

- 39 ■ Durable Materials
- 40 ■ Varied Access Experiences

- 1 ■ Point Access (along the designated trail itself)
- 2 ■ Parking/Staging Access
- 3 ■ Buffers and Barriers
- 4 ■ Boardwalks/Bridges
- 5 ■ Overlook Points
- 6 ■ Seasonal/Periodic Closures
- 7 ■ Use Restrictions

8 In addition, a trail management plan will be developed in cooperation with the
9 same agencies. Specific design and management requirements that have already
10 been identified for each potential route are noted below. Annual monitoring
11 results may identify needs to changes in management of trail use and/or trail
12 restrictions.

13 **Impact BIO-29: Disruption of Sensitive Wildlife due to** 14 **Public Access Interactions along the Bay Trail, Southward** 15 **and Northward Extensions**

16 The habitats currently adjacent to the southward extension of the Bay Trail
17 include grassland and developed areas, and a drainage ditch along the southern
18 perimeter levee that appears to contain some riparian vegetation. Salt marsh is
19 located east of the outboard marsh, approximately 700 feet from the proposed
20 terminus of the Bay Trail. With implementation of the HWRP, tidal and seasonal
21 wetlands would be established north of the Bay Trail in this area.

22 The habitats currently adjacent to the northward extension of the Bay Trail from
23 the City of Novato levee to Pacheco Pond include annual and fescue grasslands.
24 There is a drainage ditch on the south side of Pacheco Pond and west of where
25 the Bay Trail may be routed. With implementation of the HWRP, seasonal
26 wetlands would be established east of the levee on the west side of the HWRP.

27 Public access along these portions of the Bay Trail has the potential to disrupt
28 existing wildlife that uses the grassland and drainage ditch along the southern
29 trail extension and the grasslands along the northward extension to Pacheco
30 Pond. Because the southern extension of the Bay Trail would stop 700 feet west
31 of the existing salt marsh, access impacts on the existing salt marsh would be less
32 than significant. Future access has the potential to disrupt sensitive wildlife that
33 may utilize the seasonal and tidal wetlands to be created by the HWRP. This
34 impact is considered significant because it would conflict with the project
35 objectives, and Mitigation Measure BIO-12 is recommended to reduce this
36 impact. In the context of the substantial increases in wetland habitat that result
37 from the project and by adding screening and buffer zones around the public
38 access components and the other elements of this measure, the impact associated
39 with access on sensitive wildlife would be less than significant.

1 **Mitigation Measure BIO-12: Implement Specific Design and**
2 **Management Mitigation for Bay Trail Southward Extension and**
3 **Northward Extension from City of Novato Levee.**

4 The following will be incorporated into the design and trail management for the
5 southward and northward extension of the Bay Trail from the City of Novato
6 levee.

- 7 ■ Place signage at the terminus of the southward extension trail along the
8 perimeter levees.
- 9 ■ Place physical buffers (such as vegetation), periodic signage, or barriers
10 (such as fencing), as determined in consultation with USFWS and DFG to
11 prevent or discourage public access into areas of sensitive species habitat.
- 12 ■ Prohibit all dog and motorized vehicle access (except for emergency
13 vehicles).
- 14 ■ Consider seasonal closures of the trail spur along the southern perimeter
15 levee during the peak breeding seasons of sensitive species (such as
16 Saltmarsh Common Yellowthroat and California Clapper Rail), in
17 consultation with DFG and USFWS, once the restored seasonal and tidal
18 wetland areas begin to be used by sensitive species.

19 **Impact BIO-30: Changes in Predator Access**

20 At present, the BMKV site provides unimpeded access for predators, such as
21 dogs, red-tailed fox, and raccoons, to the salt marsh outboard of the perimeter
22 levees and the other habitats onsite. Such access may affect the sensitive species
23 found in these marsh areas, such as the California Clapper Rail.

24 Implementation of one of the restoration alternatives would reduce, but not
25 eliminate predator access to the outboard marsh. Each alternative would include
26 the construction of levees for control of tidal flooding or improvement of existing
27 levees and berms. These levees and berms would continue to provide predator
28 access to portions of the outboard marsh. However, the access across the
29 existing agricultural fields would be impeded due to the introduction of tidal
30 flows across the site, and the perimeter levees would be lowered to an
31 approximate high-tide level, which should reduce predator use and access to
32 portions of the outboard marsh. As noted above, the trail management plan for
33 the Bay Trail and any spur trails built as part of the project would prohibit people
34 from bringing dogs on the site. Because the project would reduce predator access
35 compared to the existing setting, this impact is considered less-than-significant.

36 The Conservancy or successor in interest would work with USFWS to
37 incorporate predator management into the overall management of the restoration
38 site.

1 **Impact BIO-31: Potential Harm to Marine Mammals,**
2 **Special-Status Fish Species, and Common Fish Species**
3 **due to Pile-Driving Activities for Off-Loader Facility and**
4 **Booster-Pump Platforms**

5 The dredged material off-loading facility and booster-pump platform might be
6 built on piles. Pile-driving activities, if conducted, could disturb marine
7 mammals, sensitive fish species, and/or common fish species near the platforms
8 in San Pablo Bay. The piles that would be used are estimated to be
9 approximately 36 inches wide (.91 meters). Based on the estimated amount of
10 piles necessary, pile-driving activities could take approximately 1 month.

11 Harbor seals use Sisters Rocks (approximately 2,100 yards south of the location
12 of the off-loading facility) and Castro Rocks, adjacent to the Richmond–San
13 Rafael Bridge, (approximately 7,000 yards southeast) as haul-out sites for resting
14 and breeding. Castro Rocks is the largest haul-out site in the North Bay and the
15 second largest breeding site in the San Francisco Bay. Harbor seals also use
16 Lower Tubbs Island as a haul-out site (approximately 11,000 yards northeast of
17 the approximate off-loading facility).

18 Several special-status fish species are known to occur or have the potential to
19 occur in the vicinity of the proposed expansion area, including longfin smelt;
20 Central Valley and Central Coast steelhead; winter-run, spring-run, and fall-run
21 chinook salmon; and coho salmon.

22 Common fish species in San Pablo Bay include jacksmelt, topsmelt, northern
23 anchovy, Pacific herring, bat ray, leopard shark, plainfin midshipmen, white
24 croakers, bay gobies, shiner perch, English sole, speckled sand dab, California
25 halibut, white sturgeon and others (California Department of Fish and Game
26 2002). Because pile-driving studies have not been completed for equipment of the
27 size proposed for this project, this analysis is based on the results of the pile
28 installation demonstration project (PIDP) that was conducted for the San
29 Francisco–Oakland Bay Bridge East Span Seismic Safety Project (East Span
30 Project) (Caltrans 2001a, 2001b). Caltrans evaluated impacts to marine
31 mammals and special-status fish species resulting from large pile-driving
32 hammers (rated 500 to 1,700 kilojoules [kJ]) (Caltrans 2001a, 2001b). The
33 hammers studied in the PIDP were far larger than the equipment that would be
34 used for this project (estimated to be rated 110 to 220 kJ). Hammers delivering
35 up to 200 kJ are commonly used for marine and near-shore construction around
36 the Bay.

37 The PIDP for the East Span Project did not identify any apparent effect of pile
38 driving on the Yerba Buena harbor seal haul-out site, which was located
39 approximately 1 mile from the pile-driving activity. Because the nearest haul-out
40 sites are both located more than 1 mile from the approximate location of the
41 HWRP off-loading facility and booster-pump platforms, and the PIDP studied far
42 more powerful pile-driving hammers, pile-driving activity at the platforms is not
43 expected to affect the identified haul-out sites.

1 Pile-driving activity may disturb harbor seals or other marine mammals
2 swimming in the immediate vicinity of the activity. NMFS considers in-air noise
3 levels below 85 decibels (dB) safe for marine mammals, but the pile-driving
4 activity is likely to result in in-air noise levels in excess of 85 dB. NMFS has
5 determined that elevated underwater sound pressure levels (SPLs) of 180 to 190
6 dB or higher could cause temporary hearing impairment or threshold shifts in
7 marine mammals, thus disrupting their behavior. In the PIDP for the East Span
8 Project, the 190 dB contour for hammer energy level of 750 kJ was calculated as
9 185 meters. While not specifically studied, it is reasonable to assume that the
10 190 dB contour for the pile-driving equipment likely to be used for the HWRP
11 would be far less than 185 meters. Marine mammals in the water in the
12 immediate vicinity of the piles for the proposed expansion would be temporarily
13 displaced if they choose to avoid the area in response to high sound pressure
14 levels. While the specific sound pressure levels of the equipment proposed for
15 pile-driving activity for this project have not been studied, it is assumed that the
16 SPLs may reach or exceed the 190 dB contour, at least in the immediate vicinity
17 of pile-driving activity. This impact is considered potentially significant.
18 Implementation of Mitigation Measure BIO-13 would reduce these impacts.
19 However, even with mitigation, there is the potential for harassment of marine
20 mammals if an individual were to swim immediately adjacent to pile-driving
21 activity. This impact is therefore considered significant and unavoidable, if pile-
22 driving is used.

23 The PIDP for the East Span Project also documented fish mortality due to
24 contraction and expansion of the swim bladder in an immediate mortality zone
25 approximately 10 to 12 meters from the pile-driving activity. A delayed
26 mortality zone, wherein injury was identified to the inner ear or other fish organs
27 that may result in mortality several hours to several days after injury, was
28 estimated to be located in a radius of at least 150 meters and possibly as large as
29 1,000 meters (Caltrans 2001b).

30 While population-level impacts to fish are not expected, pile-driving activity may
31 result in individual mortality in fish species present in the immediate vicinity of
32 pile-driving. For common species of fish, individual mortality of fish is
33 considered a less-than-significant impact.

34 Regarding listed fish species, the proposed project will provide rearing and
35 refuge habitat in the subtidal channels that will be created within the tidal marsh
36 restoration areas. However, although the effect is limited in duration and scale,
37 there remains a potential for pile-driving to harass individual marine mammals
38 and a potential for individual mortality of listed species. This impact is therefore
39 considered potentially significant. Implementation of Mitigation Measure BIO-
40 13 would reduce this impact. However, even with mitigation, there is the
41 potential for individual mortality of listed fish species immediately adjacent to
42 pile-driving activity. This impact is considered significant and unavoidable, if
43 pile-driving is used and listed species of fish are present in the immediate vicinity
44 of pile-driving activity.

1 **Mitigation Measure BIO-13: Coordinate with Appropriate Federal**
2 **and State Agencies to Reduce Impact on Marine Mammals and**
3 **Special-Status Fish Species during Pile-Driving Activities.**

4 The Conservancy, Corps, or successors in interest will consult with NMFS and
5 DFG in order to implement measures to reduce impacts associated with pile-
6 driving activities to marine mammals and special-status fish species. These
7 measures could include but are not limited to the following.

- 8 ■ Scheduling pile-driving activities to occur outside the peak juvenile
9 outmigration periods for chinook and steelhead salmon whenever possible.
- 10 ■ Monitor marine mammals during pile-driving activity, ceasing pile-driving
11 activity temporarily if marine mammals approach within 100 meters.
- 12 ■ Monitor sound attenuation.

13 **Impact BIO-32: Potential Disruption to Nesting Special-**
14 **Status and Common Birds due to Removal of Several**
15 **Eucalyptus Groves and Several Oak Trees**

16 Construction activities associated with the proposed wetland restoration,
17 including levee and seasonal wetland construction, would result in the permanent
18 loss of several eucalyptus groves and several individual oak trees located east of
19 Pacheco Pond. Although eucalyptus trees are non-native and abundant, loss of
20 these trees would remove nesting habitat for special-status and common raptors,
21 migratory birds, and other bird species. Eggs and nests of all birds are protected
22 under Section 3503 of the California Department of Fish and Game Code. Other
23 eucalyptus habitat exists just north of this area on Headquarters Hill, where
24 potentially displaced wildlife could relocate to, and in the general area there are
25 ample alternative nesting locations.

26 The removal of non-native trees and several individual oak trees themselves is
27 considered a less-than-significant effect. A large quantity of non-native trees
28 remaining in an area close to restored seasonal and tidal wetland habitats is
29 considered incompatible with the project goal and objectives because it would (1)
30 hinder the ability to create the seasonal wetland; (2) retain non-natural habitat
31 potentially supporting an unnaturally large amount of raptor roosts; and (3) result
32 in enhanced ability of those raptors to prey on special-status species in the
33 restored habitat areas. While predation is a natural part of the ecosystem,
34 retention of a non-native grove so close to threatened- and endangered-species
35 habitat is not considered supportive of the project goal and objectives.

36 However, the potential disruption to special-status birds and/or other bird nesting
37 is considered significant. Implementation of Mitigation Measure BIO-14 would
38 reduce this impact to a less-than-significant level.

1 **Mitigation Measure BIO-14: Remove Identified Eucalyptus Groves**
2 **and Oak Trees outside Special-Status and Other Bird Breeding**
3 **Seasons.** During construction, the Conservancy, Corps, or successors in
4 interest will remove trees within the identified eucalyptus groves and individual
5 oak trees outside the breeding season of any identified special-status or other bird
6 species using these trees. This will likely mean that trees will be removed
7 between September 1 and February 1 to protect nesting birds from impacts
8 associated with tree removal.

9 **Impact BIO-33: Potential Disruption to Special-Status Bat**
10 **Species due to Removal of Structures**

11 Construction of the proposed wetland restoration would require the removal of
12 several existing structures on the project site, including a barn, house, and
13 equipment shed left from past agricultural uses of the site. The structures are all
14 abandoned and dilapidated and pose a hazard on the site, and the house and the
15 equipment shed have only a part of their roofs in place. Reconnaissance of these
16 structures did not conclusively identify bat signs within the structures. However,
17 owls and hawks were observed within the structures. Raptors are common
18 predators on bats, and their presence may decrease the likelihood of bat presence
19 in the structures. Tin roofing, present on the barn structure, does not offer the
20 needed roosting substrate for bats, although the wooden crossbeams present in
21 the barn and the other structures could potentially be used by roosting bats.
22 Because of their construction and proximity to adequate foraging areas, these
23 structures could provide roosting habitat for common and special-status bat
24 species that may occur in the vicinity of the project site (see table D-1 in
25 appendix D). No known occurrence of bat species has been documented in the
26 recent past, although surveys have not been conducted during different seasons to
27 more accurately determine potential usage. Removal of these structures could
28 result in the loss of potential roosting habitat for any common or special-status
29 bat species that may be using the structures. This impact to special-status bats is
30 considered significant (if bats are actually present). Implementation of
31 Mitigation Measure BIO-15 would reduce this impact to a less-than-significant
32 level.

33 **Mitigation Measure BIO-15: Conduct Site Surveys for Presence of**
34 **Special-Status Bat Species and Remove Structures in accordance**
35 **with State and Federal Laws.**

36 Surveys for evidence of bat roosting activity will be conducted by a qualified bat
37 biologist during the spring (March–mid May), summer (mid May–mid August)
38 and fall (mid August–mid October) seasons of the year prior to structure
39 removal. A total of 3 surveys will be completed prior to project construction.
40 Surveys will be conducted at least once during each season and will employ the
41 following survey methods.

- 1 ■ Visual inspection of the structures for bat signs such as urine stains and
2 guano.
- 3 ■ If the visual inspections indicate bats are present, emergence surveys will be
4 conducted to determine an estimate of roosting bat numbers.
- 5 ■ If bats are present and the need to identify species is expressed through
6 coordination with DFG, acoustic surveys will be conducted using appropriate
7 bat call analysis software. If bats are not found to be using the structures as
8 roosting habitat, no further mitigation will be required.
- 9 ■ If bats are found to be using the structures as roosting habitat, the bat
10 biologist will consult with the DFG to determine the need for and timing and
11 type of appropriate mitigation measures. These measures may include, but
12 are not limited to, avoidance and/or construction and placement of bat boxes
13 near the structures in combination with accepted means of bat exclusion from
14 the structures. These measures may also include a requirement for limiting
15 construction activities by time of day and season to ensure the least degree of
16 impacts on bats species. Designated measures will be implemented prior to
17 commencement of the wetland construction.

18 **Impact BIO-34: Loss of Agricultural Land**

19 Currently, the project site is mainly composed of agricultural lands that provide
20 habitat for common wildlife as well as foraging habitat for raptors and foraging
21 and resting habitat for other birds. Raptor species use agricultural lands for
22 foraging because rodent prey often congregate in agricultural fields. Agricultural
23 habitats also provide foraging and resting habitat for migrating and wintering
24 waterfowl and shorebirds. With implementation of the proposed wetland
25 restoration, approximately 1,241 acres of existing agricultural lands on the
26 project site would be converted over time to tidal wetlands, seasonal wetlands,
27 and upland habitat. Impacts on agricultural lands are considered less than
28 significant because this habitat is not considered a sensitive community, is
29 prevalent in the local and regional area, and loss of this habitat would not result
30 in a substantial reduction in populations of rare or special-status species.
31 Because construction of the restoration project would occur over time, the
32 wildlife species that inhabit the site would slowly relocate to adjacent habitats
33 that provide similar foraging and resting functions.

34 **Impact BIO-35: Potential Change in Habitats in Pacheco 35 Pond and Tributaries**

36 The restoration alternatives include several actions that may affect habitats
37 currently present in Pacheco Pond and in the confluence area where Pacheco
38 Creek and Arroyo San Jose merge. These include diversion of some or all of the
39 existing outlet flow from Pacheco Pond to Novato Creek to the BMKV site and
40 the expansion of the pond. Impacts on Pacheco Pond related to construction of

1 or access along the Bay Trail are discussed separately for each alternative below.
2 Impacts on salmonid access were discussed previously under Impact BIO-9.

3 As noted in chapter 3, a new water management plan would be developed to
4 govern the use of the existing outlet and the proposed outlet to BMKV from the
5 pond. In the dry season, no diversion of flow is expected because of the limited
6 baseflow entering the pond and the expected elevation of the new outlet structure
7 (around 1.5 feet NGVD). Also, under Revised Alternative 2 dry season flow is
8 not desired in the seasonal wetland area. In the wet season, it is expected that
9 some form of dual use of both outlets is likely to occur.

10 The outlet to the tidal habitat area (Alternatives 1 and 3) or to the seasonal
11 wetland (Revised Alternative 2) would be set at approximately 1.5 feet NGVD to
12 allow management of pond surface water elevations in accordance with the
13 existing pond management agreement between MCFCWCD and DFG. Setting
14 this at a level consistent with current habitats would avert any habitat change at
15 Pacheco Pond resulting from a change in water surface levels. As noted in the
16 discussion in the *Surface-Water Hydrology and Tidal Hydraulics* section above,
17 the addition of the overflow to BMKV during high stage events would lower
18 peak stage. However, by setting the new outlet elevation appropriate with
19 current management, water surface elevations during normal conditions could be
20 consistent with the present elevations. As noted in the *Water Quality* section
21 Mitigation Measure WQ-3, the new management plan, in addition to identifying
22 operational parameters for flood control and habitat conservation, would also
23 include considerations of water quality (such as circulation and dissolved
24 oxygen).

25 The expansion of the pond and addition of fringing emergent marsh in all the
26 restoration alternatives is expected to increase the amount of open water and
27 emergent marsh habitat available for species that presently use the pond. This is
28 considered a beneficial impact.

29 Overall, the diversion of some or all of the flow from the existing outlet during
30 the wet season and the expansion of Pacheco Pond is considered to result in a
31 less-than-significant impact on existing habitats in Pacheco Pond.

32 **Impacts and Mitigation Measures Unique to Alternative** 33 **1 and Revised Alternative 2**

34 Figures 3-1 and 3-2 (in chapter 3 of this document) illustrate the distribution of
35 habitats restored, 50 years after implementation of the proposed BMKV
36 expansion, under Alternative 1. Figures 3-5 and 3-6 (in chapter 3 of this
37 document) illustrate the distribution of habitats restored, 50 years after
38 implementation of the proposed BMKV expansion, under Revised Alternative 2.
39 Table 4-7 presents a comparison between the estimated extent of habitats
40 restored under Alternative 1 and Revised 2 at year 50 and the expected net

1 change in the extent of habitats relative to the No-Action Alternative (i.e.,
2 existing conditions).

3 **Impact BIO-36: Potential Effects of Construction of and**
4 **Access to the Interpretive Center and Access Area on the**
5 **Bulge Parcel West of the HWRP**

6 Under Alternative 1 and Revised Alternative 2, the interpretive center and access
7 area would be located on the land currently owned by the City of Novato just
8 west of the HWRP. This area contains grassland, concrete pads, dirt and gravel
9 roads, and seasonal wetlands in low-lying areas. The proposed location for the
10 interpretive center is in the center of the area between the 2 seasonal wetland
11 areas in an area containing a large concrete pad, grassland, and existing roads.
12 The loss of several acres of the grasslands in this area due to interpretive center
13 construction is considered a less-than-significant impact because of the
14 availability of other grassland nearby and the relative abundance of this type of
15 habitat. Because of potential nesting in and adjacent to the interpretive center
16 location in the grasslands or seasonal wetlands, Mitigation Measures BIO-1 and
17 BIO-5, described above, should be implemented during construction.

18 Vehicle and foot access to the interpretive center and access between the
19 interpretive center and the nearby portion of the Bay Trail could affect habitats
20 along the access routes and/or species that may use the adjacent seasonal
21 wetlands. The following mitigation measures should be incorporated into the
22 final design of the interpretive center and access routes, if built at this location, to
23 reduce impacts of construction and access on biological resources to less than
24 significant.

25 **Mitigation Measure BIO-16: Recommended Mitigation Measures for**
26 **Construction of and Access to and from the Interpretive Center and**
27 **Access Area on the Bulge parcel west of HWRP.**

28 The following measures are recommended to the parties that construct and
29 operate the interpretive center, if located on the Bulge parcel immediately west of
30 the HWRP seasonal wetland area.

- 31 ■ The temporary and permanent footprint of the interpretive center,
32 improvements, access roads, and foot trails should be placed in previously
33 disturbed areas (such as existing concrete pads and along existing roads)
34 whenever feasible. The temporary and permanent footprint should be located
35 outside of the delineated seasonal wetlands. The existing roads that lead to
36 the central area from the south, and north from the central area to the future
37 location of the new levee should be used for access wherever feasible.
- 38 ■ During construction, sediment fencing should be used to prevent erosion and
39 sediment from entering the neighboring seasonal wetlands and to prevent
40 inadvertent construction access into these areas.

- 1 ■ Physical buffers (such as vegetation), barriers (such as fencing), or periodic
2 signage) should be placed between the improved areas (the interpretive
3 center ,the access road, and trail segments) and the adjacent seasonal
4 wetland areas, as appropriate and necessary to prevent access.
- 5 ■ Dog use should be prohibited at the interpretive center and on the connecting
6 trails to prevent impacts on species that may use adjacent seasonal wetlands.

7 **Impact BIO-37: Potential for Construction-Related** 8 **Mortality of Chinook Salmon, Central Valley Steelhead,** 9 **and Longfin Smelt**

10 Operation of the hydraulic off-loader intake pumps from either of the proposed
11 deep-water or shallow-water locations in San Pablo Bay could potentially result
12 in mortality of longfin smelt or chinook salmon and Central Valley steelhead
13 salmon smolts during out-migration (smolts of these species could be present in
14 San Pablo Bay from about January 1 to June 30). These species could face
15 mortality if fish are entrained in pump intakes. However, because pumping
16 operations are temporary and water would be pumped from the open waters of
17 San Pablo Bay rather than from a narrow water body (which could result in
18 channeling fish to the pump intakes), it is unlikely that these species would be
19 entrained by pump operation. Therefore, this impact is considered less than
20 significant, and no mitigation is required.

21 **Impact BIO-38: Temporary Disturbance of Fish in San** 22 **Pablo Bay during Construction**

23 Transporting dredged material to the site would require pumping the material
24 through the dredged-material pipelines across part of San Pablo Bay from
25 hydraulic off-loaders, also located in the Bay. This process could increase the
26 turbidity surrounding the hydraulic off-loaders and create the potential for fuel
27 spills, thereby causing a disturbance to the fish species in the area. Fish are
28 likely to move out of the area, however, until the water quality increases. All
29 construction activities must meet the objectives established by the San Francisco
30 RWQCB. However, drawing of water to use in slurry of dredged material
31 pumped to the expansion site may result in fish entrainment. To further reduce
32 the likelihood of fish entrainment or if resource agencies determine it to be
33 necessary, the Conservancy or successor in interest would implement Mitigation
34 Measure BIO-17.

35 **Mitigation Measure BIO-17: Use Fish Screens to Prevent Possible** 36 **Entrainment of Fish.**

37 The Conservancy, Corps, or successors in interest will install fish screens or
38 other appropriate fish exclusion devices to prevent entrainment of fish into the
39 water intakes of the hydraulic off-loader pump. Fish screens or other exclusion

1 devices will be designed to ensure intake velocities do not result in the
2 impingement of fish onto the screen or result in other scenarios which harm fish.

3 **Impacts and Mitigation Measures Unique to** 4 **Alternative 1**

5 **Impact BIO-39: Disruption of Sensitive Wildlife due to** 6 **Bay Trail Construction, Alternative 1 and Spur Option 1A**

7 The Bay Trail would be constructed through the wetland/riparian area at the
8 confluence of Arroyo San Jose and Pacheco Creek, where the creeks enter
9 Pacheco Pond, then along the Marin County Flood Control service road around
10 the west side of Pacheco Pond (see figure 3-1 in chapter 3 of this document).
11 From this point, the trail would be routed through the wetlands area on the west
12 side of Pacheco Pond and would cross the channel via bridge to Bel Marin Keys
13 Boulevard.

14 Construction would require extensive in-water work and permanent loss of
15 wetland/riparian areas along the route. Across the Arroyo San Jose/Pacheco
16 Creek confluence, assuming a 50-foot width of disturbance, construction could
17 result in loss of approximately 0.8 to 1.7 acres of wetlands depending on trail
18 route. Construction along the western edge of the wetlands near Bel Marin Keys
19 Boulevard could result in additional loss of approximately 1.1 acres of wetlands,
20 assuming a 50-foot width of disturbance. Permanent loss would depend on the
21 width of boardwalk or bridge structures utilized. In-water work could affect
22 aquatic and riparian species found in and adjacent to the proposed route and
23 could temporarily increase sedimentation and turbidity in Pacheco Pond.
24 Construction noise and activity could also affect foraging and breeding behavior
25 of fish and wildlife species that utilize Pacheco Pond and the lower portions of
26 the 2 feeding creeks.

27 Placement of a trail through the wetland/riparian area at the southwest end of
28 Pacheco Pond would create a physical disruption to the existing wetland/pond
29 interface or within the wetland/riparian area, depending on routing. The trail
30 would require at least 1 and possibly 2 or more bridge segments in the confluence
31 area and an approximately 200-foot bridge to reach Bel Marin Keys Boulevard
32 across the outlet channel of Pacheco Pond.

33 Spur Option 1A would be constructed on areas previously disturbed by other site
34 preparation and construction. Construction of the trail itself, if it occurred before
35 wetland creation/levee breaching, would not be expected to result in any
36 additional impacts to sensitive wildlife beyond those already described for
37 general site construction activities. If trail construction were to occur after
38 restored wetlands have established or begun to be established, then the mitigation
39 proposed above, including Mitigation Measures BIO-1, 3, 4, 5, and 6, will be

1 applied to trail-construction activities. With implementation of this mitigation,
2 the construction impact of Spur Option 1A is considered less than significant.

3 Given the presence of wetland, riparian, and aquatic environments along the
4 potential route, the impact of construction of the Bay Trail west of Pacheco Pond
5 is considered significant. Mitigation Measures BIO 1, 3, and 5, described above,
6 are recommended as mitigation for this alternative. In addition, Mitigation
7 Measure BIO-18 is recommended for this alternative.

8 **Mitigation Measure BIO-18: Implement Specific Design and**
9 **Management Recommendations for Construction of Trail West of**
10 **Pacheco Pond.**

11 The following will be incorporated into construction plans if the Bay Trail route
12 under Alternative 1 is implemented.

- 13 ■ Contribute to future riparian restoration efforts on Pacheco Creek or Arroyo
14 San Jose Creek in a manner sufficient to offset loss of riparian habitat
15 brought about by construction and installation of trail across confluence.
- 16 ■ Carry out construction outside of the peak breeding seasons of sensitive
17 species (such as salt marsh common yellowthroat) and migratory waterfowl,
18 in consultation with DFG and USFWS.
- 19 ■ Minimize use of fill as foundations for bridge and boardwalk structures in
20 wetland areas, where feasible.
- 21 ■ Incorporate best management practices during construction to prevent
22 sedimentation of the wetland areas.
- 23 ■ Provide design plans to DFG and USFWS prior to construction to determine
24 any additional mitigation necessary to reduce impacts on species using
25 confluence area and Pacheco Pond.

26 **Impact BIO-40: Disruption of Sensitive Wildlife due to**
27 **Public Access Interactions along Bay Trail, Alternative 1**

28 The Bay Trail under Alternative 1 would be adjacent to the open water and
29 wetland habitat of Pacheco Pond and would be within the riparian/wetland
30 habitat at the confluence of Pacheco Creek and Arroyo San Jose. No separation
31 between the trail and the riparian/wetland habitat is possible, unless the trail is
32 moved onto a boardwalk across the open water area of Pacheco Pond for which
33 the feasibility is unknown. The route along the existing service road would be
34 near the western edge of Pacheco Pond and associated wetlands. The route north
35 from the end of the service road to Bel Marin Keys Boulevard would be on a
36 boardwalk over the wetlands adjacent to the Pond outlet. Given the proximity of
37 the trail route to these environments, the feasibility and efficacy of buffering
38 approaches is limited.

1 Lacking buffers or separation, public access is more likely to disrupt wildlife use
2 of immediately adjacent environments around Pacheco Pond. In particular, bird
3 breeding activity in and adjacent to Pacheco Pond would be affected by public
4 access.

5 Given the presence of wetland, riparian, and aquatic environments immediately
6 adjacent to the potential route, the impact of access is likely to be significant.
7 Mitigation Measures BIO-12, BIO-19a, and BIO-19b are recommended to reduce
8 this impact. In the context of the substantial increases in wetland habitat
9 resulting from the project and with implementation of these measures, the impact
10 of access on sensitive wildlife would be less than significant.

11 **Mitigation Measure BIO-19a: Implement Specific Design and**
12 **Management Recommendations for Bay Trail Alternative 1.**

13 The following will be incorporated into the design and trail management plan if
14 the Bay Trail route in Alternative 1 is implemented.

- 15 ■ Place physical buffers (such as vegetation), barriers (such as fencing), or
16 periodic signage between the trail and Pacheco Pond, where appropriate and
17 necessary.
- 18 ■ Prohibit all dog access.
- 19 ■ Prohibit fishing and boating access from the trail to Pacheco Pond (fishing,
20 swimming, and boating are presently prohibited at the pond).
- 21 ■ Consider seasonal closures of the trail spur during peak breeding seasons of
22 sensitive species (such as Saltmarsh Common Yellowthroat) or other species
23 that use the confluence area, in consultation with DFG and USFWS.

24 **Mitigation Measure BIO-19b: Implement Specific Design and**
25 **Management Recommendations for Spur Option 1A.**

26 The following will be incorporated into the design and trail management plan if
27 Spur Option 1A is implemented.

- 28 ■ Locate trail a minimum of 300 feet from tidal marsh habitat.
- 29 ■ Locate trail on the northern slope of the central crossing levee to avoid direct
30 visual and physical proximity to restored tidal wetlands areas. Provide
31 periodic point access to the top of the levee for visual access.
- 32 ■ Place physical buffers (such as vegetation), barriers (such as fencing), or
33 periodic signage, where appropriate and necessary, between the trail and the
34 tidal marsh habitat and between the trail and Pacheco Pond
- 35 ■ Impose gated access to prevent public access to the NSD access road/berm
36 between BMKV and the HAAF site.
- 37 ■ Place a physical barrier of fencing or other suitable material between the trail
38 and Novato Creek to prevent all access to the creek from the trail.

- 1 ■ Monitor wetland restoration development to determine if and when
2 California clapper rails, California black rails, or other sensitive bird species
3 begin using restored tidal marsh for breeding.
- 4 ■ Consider seasonal closures of the trail spur during peak breeding seasons of
5 the California clapper rail and California black rail. Consider additional
6 seasonal closures for other special-status species (such as salt marsh common
7 yellowthroat and San Pablo song sparrow), in consultation with DFG and
8 USFWS.
- 9 ■ Prohibit dog access along the spur trail.
- 10 ■ Prohibit fishing and boat access from trail terminus to Novato Creek and
11 from Novato Creek to trail.

12 **Impacts and Mitigation Measures Unique to Revised** 13 **Alternative 2**

14 **Impact BIO-41: Disruption of Sensitive Wildlife due to** 15 **Bay Trail Construction, Revised Alternative 2**

16 The Bay Trail under Revised Alternative 2 would be located along the levee
17 between Pacheco Pond and the HAAF site, along the levee between Pacheco
18 Pond and the BMKV expansion area, and across upland areas around the west
19 side of Headquarters Hill leading to Bel Marin Keys Boulevard (see figure 3-5 in
20 chapter 3 of this document). Because the Bay Trail route under this alternative
21 would be constructed on areas previously disturbed by other site preparation and
22 construction, construction of the trail itself, if it occurred before wetland
23 creation/levee breaching, would not be expected to result in any additional
24 impacts to sensitive wildlife beyond those already described for general site
25 construction activities. If trail construction were to occur after restored wetlands
26 have established or begun to be established, then the mitigation proposed above,
27 including Mitigation Measures BIO-1, 3, 4, 5, and 6, should be applied to trail-
28 construction activities. With implementation of this mitigation, as necessary, this
29 impact is considered less than significant.

30 **Impact BIO-42: Disruption of Sensitive Wildlife due to** 31 **Bay Trail Access, Revised Alternative 2**

32 The Bay Trail under Revised Alternative 2 would be adjacent to the western side
33 of the HAAF parcel, Pacheco Pond, the BMKV seasonal wetland restoration
34 area, Headquarters Hill, and upland areas. This proximity may create public
35 access conflicts with sensitive wildlife as discussed above.

36 Mitigation Measures BIO-12 and BIO- 20 are recommended to reduce this
37 impact. In the context of the substantial increases in wetland habitat resulting

1 from the project and with implementation of these measures, the impact of access
2 on sensitive wildlife would be less than significant.

3 **Mitigation Measure BIO-20: Implement Specific Design and**
4 **Management Recommendations for Bay Trail Revised Alternative 2.**

5 The following will be incorporated into the design and trail management plan if
6 the Bay Trail under Revised Alternative 2 is implemented.

- 7 ■ Place physical buffers (vegetation), barriers (such as fencing), or periodic
8 signage) between the trail and Pacheco Pond and between the trail and the
9 restored seasonal wetland area, as appropriate and necessary.
- 10 ■ Impose gated access to prevent public access to the NSD access road/berm
11 between BMKV and the HAAF site.
- 12 ■ Prohibit all dog access.
- 13 ■ Prohibit fishing and boating access from the trail to Pacheco Pond (fishing,
14 swimming, and boating are presently prohibited at the pond).

15 **Impacts and Mitigation Measures Unique to**
16 **Alternative 3**

17 **Impact BIO-43: Disruption of Sensitive Wildlife due to**
18 **Bay Trail Construction, Alternative 3 and Spur Option 3A**

19 The Bay Trail under Alternative 3 would be located along the levee between
20 Pacheco Pond and the HAAF parcel, along the levee around the east side of the
21 expanded Pacheco Pond, and across upland areas leading to Bel Marin Keys
22 Boulevard (see figure 3-8 in chapter 3 of this document). Spur Option 3A would
23 add a trail from the east side of Pacheco Pond to Novato Creek on the new levee
24 south of the BMK south lagoon levee.

25 Because the Bay Trail route under this alternative and Spur Option 3A would be
26 constructed on areas previously disturbed by other site preparation and
27 construction, construction of the trail itself or Spur Option 3A, if it occurred
28 before wetland creation/levee breaching, would not be expected to result in any
29 additional impacts to sensitive wildlife beyond those already described for
30 general site construction activities. If trail construction were to occur after
31 restored wetlands have established or begun to be established, then the mitigation
32 proposed above, including Mitigation Measures BIO-1, 3, 4, 5, and 6, should be
33 applied to trail-construction activities. With implementation of this mitigation, as
34 necessary, this impact is considered less than significant.

1 **Impact BIO-44: Disruption of Sensitive Wildlife due to**
2 **Bay Trail Access, Alternative 3 and Spur Option 3A**

3 The Bay Trail under Alternative 3 would be adjacent to the HAAF site, the
4 expanded Pacheco Pond, and upland areas. Spur Option 3A would be adjacent to
5 the BMKV tidal wetland restoration and to Novato Creek. This proximity may
6 create public access conflicts with sensitive wildlife as discussed above. Spur
7 Option 3A would place a trail closer to the restored tidal wetland than in either of
8 the other 2 alternatives because there is no upland buffer on the outboard side of
9 the new levee.

10 Mitigation Measures BIO-12, BIO- 21a, and BIO 21b would also be necessary to
11 reduce this impact to a less-than-significant level. In the context of the
12 substantial increases in wetland habitat resulting from the project and with
13 implementation of these measures, the impact of access on sensitive wildlife
14 would be less than significant.

15 **Mitigation Measure BIO-21a: Implement Specific Design and**
16 **Management Recommendations for Bay Trail Alternative 3.**

17 The following will be incorporated into the design and trail management plan if
18 the Bay Trail Alternative 3 is implemented.

- 19 ■ Locate trail on the eastern slope of the expanded Pacheco Pond levee to
20 avoid direct, constant physical proximity to Pacheco Pond. Provide periodic
21 point access to the top of the levee for visual access.
- 22 ■ Place physical buffers (such as vegetation), barriers (such as fencing), or
23 periodic signage between the trail and the expanded Pacheco Pond, as
24 appropriate and necessary.
- 25 ■ Impose gated access to prevent public access to the NSD access road/berm
26 between BMKV and the HAAF site.
- 27 ■ Prohibit all dog access.
- 28 ■ Prohibit fishing and boating access from the trail to Pacheco Pond (fishing,
29 swimming, and boating are presently prohibited at the pond).

30 **Mitigation Measure BIO-21b: Implement Specific Design and**
31 **Management Recommendations for Trail Spur Option 3A.**

32 The following will be incorporated into the design and trail management plan if
33 Option 3A is implemented.

- 34 ■ Locate trail a minimum of 300 feet from existing and future tidal marsh
35 habitat.
- 36 ■ Locate trail on the western slope of the levee that is south of the BMK south
37 lagoon levee to avoid direct visual and physical proximity to restored tidal
38 wetlands areas. Provide periodic point access to the top of the levee for
39 visual access.

- 1 ■ Place physical buffers (such as vegetation), barriers (such as fencing), or
2 periodic signage between the trail and the tidal marsh habitat, as appropriate
3 and necessary. Place a physical buffer of fencing or other suitable material
4 between the trail and Novato Creek to prevent all creek access from the trail.
- 5 ■ Monitor wetland restoration development to determine if and when
6 California clapper rails, California black rails, or other sensitive bird species
7 begin using restored tidal marsh for breeding.
- 8 ■ Consider seasonal closures of the trail spur during peak breeding seasons of
9 the California clapper rail and California black rail. Consider additional
10 seasonal closures for other special-status species (such as salt marsh common
11 yellowthroat and San Pablo song sparrow), in consultation with DFG and
12 USFWS.
- 13 ■ Prohibit dog access along the spur trail.
- 14 ■ Prohibit fishing and boat access from trail terminus to Novato Creek and
15 from Novato Creek to the trail.

1 Land Use and Public Utilities

2 Affected Environment

3 Data Sources

4 The following documents and policies were used to prepare this section.

- 5 ■ *Marin Countywide Plan and Marin County Zoning Code* (Marin County
6 Community Development Agency 1994)
- 7 ■ *City of Novato General Plan* (City of Novato 1996)
- 8 ■ *Bay Trail Plan* (Association of Bay Area Governments 1989)
- 9 ■ *Long-Term Management Strategy Plan* (1996)
- 10 ■ *San Francisco Bay Area Wetlands Ecosystem Goals Project* (1998)
- 11 ■ *San Francisco Bay Plan* (San Francisco Bay Conservation and Development
12 Commission 1969, as amended)
- 13 ■ Coastal Zone Management Act

14 Land Ownership

15 Land ownership in the vicinity of the proposed expansion is described below. If
16 development associated with the BMKV expansion is carried out on lands not
17 owned by the project sponsors, owner approval will be required prior to
18 implementation of any development activities.

19 Federal and State Ownership

20 The BMKV expansion site is owned by the Conservancy. The SLC parcel is
21 owned by the State Lands Commission. The HAAF parcel is owned by the
22 Corps.

23 Local and Private Ownership

24 Pacheco Pond is owned by MCFCWCD. The City of Novato owns portions of
25 Ammo Hill and the Bay Trail. Headquarters Hill is under private ownership.

Regulatory Setting

Marin Countywide Plan

The Marin Countywide Plan (MCP) is a long-range comprehensive plan that governs growth and development in the unincorporated areas of the county. The proposed BMKV expansion site falls within this jurisdiction. The Marin County Community Development Agency (MCCDA) is the party responsible for administering the MCP. According to MCCDA staff, the proposed wetland restoration project is not considered a “development” in the context of the MCP (Marin County Community Development Agency 2002 see Comment letter L-9 in Responses to Comment volume). Based on this interpretation, the project would not be subject to the MCP policies for development, including those related to agriculture. However, in response to public comment on the project’s consistency with MCP policies, this section reviews key MCP policies relevant to the project. Appendix J provides a more comprehensive review of project consistency with MCP policies. The county land use designations relevant to the expansion site are discussed in a separate section below. Flood zoning is discussed separately above in the *Surface Water Hydrology and Tidal Hydraulics* section.

Key policies and programs governing land uses on the expansion site are listed below.

- **Policy EQ-2.42: Wildlife and Aquatic Habitats.** The County shall preserve and enhance the diversity of wildlife and aquatic habitats found in the Marin County bayfront lands, including tidal marshes, seasonal marshes, lagoons, wetlands, agricultural lands, and low-lying grasslands overlying historical marshlands.
- **Policy EQ-2.43: Development and Access Limitations in Bayfront Conservation Areas.** Development shall not encroach into sensitive wildlife habitats, limit normal range areas, create barriers which cut off access to food, water, or shelter, or cause damage to fisheries or fish habitats. Buffer zones between development and identified or potential wetland areas shall be provided. Access to environmentally sensitive marshland and adjacent habitat shall be restricted, especially during spawning and nesting seasons.
 - **Program EQ-2.43a: Wetland Impact Mitigation.** Development should be sited to avoid wetland areas so that the existing wetlands are preserved. The next priority would be to restore or enhance the wetland environment on-site, provided that no net loss of wetlands occurs. Restoration of wetlands off-site should only be allowed when it has been demonstrated that on-site restoration is not possible and there is no net loss of wetlands. For each acre of wetland lost, two acres shall be restored and should be of the same type of wetland habitat as that which was lost.

- 1 □ Program EQ-2.43b: Reduce Impacts to Wetlands. All technically
2 feasible measures will be taken to reduce impacts and losses to the
3 original wetland.
- 4 □ Program EQ-2.34c: Criteria for Evaluating Projects. The following
5 criteria shall be considered when evaluating development projects which
6 may impact wetland areas and should be incorporated into mitigation
7 measures:
- 8 ■ No net losses shall occur in wetland acreage, functions, and values.
- 9 ■ Mitigation should be implemented prior to, or concurrently with, the
10 project component which is causing the adverse impact.
- 11 ■ An area of adjacent upland habitat should be provided for wetland
12 species that require such habitat.
- 13 ■ Mitigation sites should be permanently guaranteed for open space
14 and wildlife habitat purposes.
- 15 ■ Mitigation for wetland destruction should be implemented on an on-
16 wetland site, or historical wetland site.
- 17 ■ Restoration of wetlands is preferred to creation of new wetland areas,
18 due to the greater likelihood of success.
- 19 ■ Mitigation projects should minimize the need for long-term
20 maintenance and operational manipulation (dredging, artificial water
21 level controls, etc.). Self-sustaining projects are encouraged.
- 22 ■ All plans to mitigate or minimize adverse impacts to wetland
23 environments shall include provisions to monitor the success of the
24 restoration project. The measures taken to avoid adverse impacts
25 may be modified if the original plans prove to be unsuccessful.
26 Performance bonds may be required.
- 27 ■ Mitigation must be commensurate with adverse impacts of the
28 wetland alternation and consist of providing similar values and
29 greater wetland acreage than those of the wetland area adversely
30 affected. All restored or created wetlands shall have the same or
31 equivalent habitat value as the wetland lost.
- 32 □ Program EQ-2.43d: Establish Criteria for Buffer Zones. The County
33 Community Development Agency shall establish criteria for determining
34 the size of upland habitat areas (buffer zones) between development and
35 wetland areas to be used in review of individual development
36 applications.
- 37 ■ **Policy EQ-2.44: Tidelands Subzone.** The purpose of this subzone is to
38 define those areas which should be left in their natural state because of their
39 biological importance to the estuarine ecosystem. The County shall prohibit
40 diking, filling, or dredging in areas subject to tidal action (Tidelands
41 subzone) unless the area is already developed and currently being dredged.
42 Current dredging operations for maintenance purposes may continue subject

1 to environmental review, if necessary. In some cases, exceptions may be
2 made for areas which are isolated or limited in productivity. In tidal areas,
3 only land uses which are water-dependent shall be permitted, as consistent
4 with federal, state, and regional policy. These include, but are not limited to:
5 ports; water-related industry and utilities; essential water conveyance;
6 wildlife refuge; and water-oriented recreation. Exemptions may be granted
7 for emergency or precautionary measures taken in the public interest, e.g.,
8 protection from flood or other natural hazard. Removal of vegetation shall
9 be discouraged. Alteration of hydrology should only be allowed when it can
10 be demonstrated that the impact will be beneficial or non-existent.

- 11 ■ **Policy EQ-2.45: Diked Historic Marshlands Subzone.** The County shall
12 through its land use and development regulations, foster the enhancement of
13 the wildlife and aquatic habitat value of the diked historic marshlands
14 subzone. Land uses which provide or protect wetland or wildlife habitat, and
15 which do not require diking, filling, or dredging, shall be encouraged. These
16 uses include, but are not limited to restoration to tidal status; restoration to
17 seasonal wetlands; agricultural use; flood basin and wastewater reclamation
18 area. In addition, other uses which do not require diking, filling, or dredging,
19 may be allowed if such uses are consistent with the zoning designation and it
20 can be demonstrated that impacts to the bayfront environment are minimized
21 and mitigated. When development is proposed, priority should be given to
22 water oriented uses such as public access and low intensity passive
23 recreational and educational opportunities.
- 24 ■ **Policy EQ-2.46: Freshwater Habitats.** Freshwater habitats in the bayfront
25 areas associated with freshwater streams and small former marshes should be
26 preserved and/or expanded so that the circulation, distribution, and flow of
27 the fresh water supply is facilitated.
- 28 ■ **Policy EQ-2.47: Use of Flood Barriers for Seasonal Habitat.** Natural or
29 managed flood basins should be utilized to provide seasonal habitat for
30 waterfowl and shorebirds.
- 31 ■ **Policy EQ-2.49: Planned District Development Review with**
32 **Environmental Assessment.** The County shall review all proposed
33 development within the Bayfront Conservation Zone in accordance with the
34 planned district review procedure in order to ensure maximum possible
35 habitat restoration and protection. An Environmental Assessment of existing
36 environmental conditions (biologic, geologic, hazard, and aesthetic) shall be
37 required prior to submittal of development plans.
- 38 ■ **Policy EQ-2.50: Coordination with Trustee Agencies within Bayfront**
39 **Conservation Areas.** The County shall facilitate consultation and
40 coordination with the trustee agencies (Department of Fish and Game, U.S.
41 Fish and Wildlife Service, the Corps of Engineers, EPA, Regional Water
42 Quality Control Board, and BCDC) during environmental review and during
43 review of other proposals for lands within the Bayfront Conservation Zone.
- 44 □ **Program EQ-2.50a: Early Consultation with Other Agencies.** Any
45 development within the Bayfront Conservation Zone is subject to the

1 review, and possibly the permit process, of federal and state agencies
2 with jurisdiction over wetlands. It is critical that the applicant consult
3 with these agencies at the very outset of a development project. The
4 County will make every effort to coordinate its review process with the
5 review process of other agencies, consulting with them on the
6 environmental assessment and the master plan. The applicant will be
7 informed at the first contact with the Community Development Agency
8 which other agencies are likely to claim jurisdiction and what the
9 policies and standards of those agencies are regarding development
10 activities in the Bayfront Conservation Zone.

- 11 ■ **Policy EQ-2.51: Minimal Impacts Within Bayfront Conservation Zone.**
12 The County shall ensure that development in the County occurs in a manner
13 which minimizes the impact of earth disturbance, erosion, and water
14 pollution within the Bayfront Conservation Zone.
- 15 ■ **Policy EQ-2.52: Disruption to Runoff and Stream Flow.** Disruption or
16 impediment to runoff and stream flow in the watersheds of Marin County
17 marshes should not be permitted if an environmental assessment indicates
18 that the quality of the water entering the marshes and bay would be
19 diminished.
- 20 ■ **Policy EQ-2.54: Tides and Currents.** The development of jetties, piers,
21 outfalls, etc., should not be allowed to alter the movement patterns of the
22 bay's tides and currents, such that significant adverse impacts would result.
- 23 ■ **Policy EQ-2.55: Bay Fill.** The County shall discourage any bay fill that
24 diverts and retards currents, increases the deposition of sediments, or causes
25 erosion and pollution.
- 26 ■ **Policy EQ-2.58: Protection of Existing Agricultural Lands.** The County
27 shall protect existing agricultural lands in the Bayfront Conservation Zone.
28 These lands are identified as an important resource for the County because
29 they are a visual and scenic resource; play an integral role in other
30 agricultural and dairy operations in Marin County; are a productive economic
31 resource; and are compatible with water-related wildlife habitat. Such
32 agricultural activities could consist primarily of grazing operations and crop
33 production harmonious with adjoining marshes, wetlands, grasslands, or
34 other sensitive lands. Agricultural lands provide habitat for many wildlife
35 species. These habitats may be important for migratory species during times
36 of flood and after silage has been cut.
- 37 ■ **Policy EQ-2.60: Pesticides, Insecticides and Similar Materials.** The
38 County will encourage the use of integrated pest management practices to
39 control pests with the least possible hazard to people, property, and the
40 environment. It is a suggested goal of the County to urge the reduction in the
41 use of pesticides and chemical treatments whenever possible. Non-toxic
42 strategies for pest control, such as modifying habitats, using physical
43 controls, and biological controls are encouraged as an alternative to chemical
44 treatment.

- 1 ■ **Policy EQ-2.61: Consistency with Environmental Hazards Element.**
2 Any development proposed for lands within the Bayfront Conservation Zone
3 must be consistent with policies and proposals of the Environmental Hazards
4 Element, including avoidance of areas that pose hazards such as: differential
5 settlement; slope instability; liquefaction; ground shaking; ground rupture;
6 tsunami; and other types of ground failures.
- 7 ■ **Policy EQ-2.62: Areas Underlain by Deposits of Bay Muds.** Those areas
8 underlain by deposits of “young muds” should be reserved for water-related
9 recreational opportunities, habitat, open space, or limited development
10 subject to approval by the Corps of Engineers and other trustee agencies.
- 11 ■ **Policy EQ-2.63: Sites with Poor Soils Conditions or Seismically Active.**
12 Any development (within watershed areas) proposed for sites that have poor
13 soil conditions for construction or that are seismically active should be
14 designed to minimize: earth disturbance; erosion; water pollution; and
15 hazards to public safety.
- 16 ■ **Policy EQ-2.64: Land Uses in Floodplains.** Areas defined as floodplain
17 should serve the dual purpose of habitat and flood protection. Areas should
18 be evaluated periodically to determine whether increases in the volume and
19 rate of runoff from urbanization or natural forces warrant further flood
20 mitigation measures.
- 21 ■ **Policy EQ-2.65: 100-year Floodplain.** The County’s regulatory procedures
22 should reflect 100-year floodplain areas as determined by the Federal
23 Emergency Management Agency (FEMA).
- 24 ■ **Policy EQ-2.66: Use of Shoreline Areas.** Public use of shoreline areas is
25 desirable and should be encouraged consistent with ecological and safety
26 considerations.
- 27 ■ **Policy EQ-2.67: Ensuring Public Access of Shoreline Areas.** The County
28 shall ensure that public access is provided and protected along the bayfront
29 and significant waterways. Public access should be allowed only where
30 access can be accommodated without damaging wildlife habitat.
- 31 ■ **Policy EQ-2.68: Public Access Easements.** The County will accept, as
32 resources permit, public access easements where the offered easement is in a
33 developed area and substantial use could be expected by local residents.
34 Where the County accepts an easement, it will be responsible for signing,
35 providing appropriate facilities, and maintaining the easement. If the County
36 does not accept an easement, it shall attempt to find appropriate public or
37 private agencies to do so.
- 38 ■ **Policy EQ-2.69: Evaluation of New Public Access Areas.** The County
39 shall evaluate potential new public access areas in order to determine the
40 feasibility of providing access and the priorities for acquisition, based on the
41 following criteria: desirability of the site; capacity to sustain use without
42 significant adverse impacts on the bayfront habitat and wildlife; potential for
43 hazard to public safety or health; availability of other public access points in
44 the area; and compatibility with adjacent land uses.

- 1 ■ **Policy EQ-2.70: Siting and Design of Public Access.** Public access should
2 be sited and designed to facilitate public use and enjoyment of the bayfront
3 lands, along with protection of wildlife habitat. Where possible, buffers and
4 upland habitat should remain, or be constructed, between wetland habitats
5 and public use areas. Public areas should be clearly marked, and continuous
6 ten-foot walkways from the nearest roads to the shoreline and along the
7 shoreline should be provided. Public access areas should be designed to
8 minimize possible conflicts between public and private uses on the
9 properties. In general, walkways should be set back at least ten feet from any
10 proposed structure. Public access shall be designed to avoid disturbance of
11 wetlands and sensitive wildlife habitat areas.
- 12 ■ **Policy EQ-2.71: Wildlife, Recreation, and Educational Uses.** Within the
13 Bayfront Conservation Zone, provisions should be made for: recreational
14 development; access to the shoreline for uses such as fishing, boating,
15 hunting, picnicking, hiking, and nature study; separated wildlife preserves.
16 Appropriate means of providing public education on the value of shoreline
17 preservation and the shoreline shall be encouraged.
- 18 ■ **Policy A-1.1: Preservation of Agricultural Lands.** Agricultural lands
19 shall be preserved by maintaining agricultural parcels in sizes large enough
20 to sustain agricultural production, avoiding conversion of agricultural land to
21 non-agricultural uses, discouraging uses which are not compatible with long
22 term agricultural productivity, and encouraging programs that assist
23 agricultural operators and owners in maintaining the agricultural productivity
24 of their land and marketing their products.
- 25 ■ **Policy A-1.6: Agricultural Lands in the Bayfront Conservation Zone.**
26 Recognizing that agricultural land is a non-renewable resource, the County
27 will, to the extent feasible and legal, preserve productive agricultural land in
28 the Bayfront Conservation Zone of the City-Centered Corridor.
29 Development projects which would affect such lands should be designed to
30 minimize loss of productive agricultural land and/or mitigate impacts on
31 agricultural production.
- 32 □ Program A-1.6a: Identify Agricultural Lands in the Bayfront
33 Conservation Zone. The County shall identify productive agricultural
34 lands in the Bayfront Conservation Zone which might be kept in
35 agricultural production.
- 36 ■ **Policy A-1.7: Intensity of Agricultural Use.** On lands located in the
37 Bayfront Conservation Zone which are suitable for agricultural preservation,
38 the County should encourage intensive agriculture for food production, in
39 addition to traditional agricultural uses like dairying and hay production.
40 Such innovative programs should be consistent with wetlands and habitat
41 preservation policies.
- 42 ■ **Policy A-1.8: Bayfront Conservation Zone (BFC).** The County will
43 continue to observe BFC Zone policies for agricultural lands in the BFC
44 Zone. These policies call for the protection of existing agricultural land as a
45 valuable county resource.

1

City of Novato General Plan

2

The City of Novato General Plan is a comprehensive long-range planning document that identifies the city's land use, transportation, environmental, economic, fiscal, and social goals and policies as they relate to the conservation and development of land in Novato. The SLC parcel is located within the City of Novato. Portions of the Bay Trail routes west of HAAF and BMKV are within the City of Novato. Key policies related to the site include:

3

4

5

6

7

8

- **EN Policy 11 Bayland Overlay Zone.** Establish a Bayland Overlay Zone to preserve and enhance natural and historic resources, including wildlife and aquatic habitats, tidal marshes, seasonal marshes, lagoons, wetlands, agricultural lands and low-lying grasslands overlaying historic marshlands.

9

10

11

12

13

14

15

16

- **EN Policy 12 Bayland Area Protection.** Regulate development in the Bayland Overlay Zone so that it does not encroach into wetlands or sensitive wildlife habitats, provided that this regulation does not prevent all use of a property. Discourage human activity that damages fisheries, or habitat for birds, fish or other wildlife.

17

18

- **EN Policy 13 Views.** Encourage protection of visual access to the San Pablo Bay Shoreline and the Petaluma River.

19

20

- **EN Policy 14 Tidal Areas.** Cooperate with State and Federal agencies to ensure that areas subject to tidal action remain in their natural state.

21

22

23

24

25

26

27

28

- **EN Policy 16 Public Access and Water-oriented Uses.** Encourage public access to shoreline areas, consistent with wildlife and habitat protection and safety considerations. Allow water-oriented uses such as public access, docks and piers, and low-intensity recreational and educational activities which provide or protect wetland or wildlife habitat, and which do not require diking, filling, or dredging. Encourage restoration to tidal status, and seasonal wetlands. Allow use of shoreline areas for flood basins, and wastewater reclamation.

29

30

31

- **EN Policy 50 Integrated Trails System.** Facilitate the development of an integrated trails system that connects regional trails, schools, open space, parks, recreation facilities, and residential areas.

32

Bay Trail

33

34

35

36

37

38

39

ABAG developed the Bay Trail Plan (Association of Bay Area Governments 1989) as a framework for the implementation of the Bay Trail project. The Bay Trail Plan's main goal is to ensure the provision of public access to the Bay and its surrounding lands. The Bay Trail is a planned recreation corridor that will provide some 400 miles (640 kilometers) of biking and hiking trails when it is complete. A proposed segment of the Bay Trail follows Perimeter Road, located on the levee that separates the expansion site from the HAAF site, and connects

1 with Bel Marin Keys Boulevard. This segment would connect to an existing trail
2 that connects with Highway 37.

3 In addition to the Bay Trail Plan, the Marin Countywide Plan and City of Novato
4 General Plan also include provisions on the Bay Trail. The Marin Countywide
5 Plan Trails Elements shows the Bay Spine Trail along the Golden Gate Bridge
6 Highway Transit District (GGBHTD) right-of-way and the Bay Spur Trail along
7 the bayfront levee in the HAAF area, which is consistent with the current City of
8 Novato General Plan. The plan also shows a continuous bayfront trail from
9 HAAF north to the existing side of Headquarters Hill (City of Novato and
10 California State Coastal Conservancy 2001).

11 The City of Novato general plan includes the following program policy regarding
12 the Bay Trail:

13 Work with the Marin County Open Space District and ABAG to implement the
14 trail system described in the Marin Countywide Plan and the Bay Trail Plan
15 (City of Novato 1996).

16 The Bay Trail route as delineated in the Novato general plan shows the trail as
17 being located along the eastern edge of Pacheco Pond. The general plan shows
18 the trail going around the western side of Headquarters Hill near Bel Marin Keys
19 Boulevard.

20 **Long-Term Management Strategy and Long-Term** 21 **Management Plan**

22 In 1990, the federal EPA, Corps, BCDC, SWRCB, RWQCB, SLC, and private
23 stakeholders established the Long-Term Management Strategy (LTMS) for
24 material dredged from San Francisco Bay. The federal EPA, Corps, BCDC,
25 SWRCB, and RWQCB cooperatively implement the LTMS.

26 The goals of the LTMS are to

- 27 ■ conduct dredging and the disposal of dredged material in an environmentally
28 and economically sound manner,
- 29 ■ develop a permit review process, and
- 30 ■ maximize the beneficial reuse of dredged materials.

31 These goals provide the foundation for the continuing management plan. The
32 LTMS management plan identifies 22 existing and potential locations for reuse
33 and placement of dredged materials, 1 of which is the proposed wetland
34 restoration site. One of the goals of the LTMS management plan is to reduce in-
35 Bay disposal of dredged material by 1.5 million cubic yards over the next decade.

1 **San Francisco Bay Area Wetlands Ecosystem Goals**
2 **Project**

3 The San Francisco Bay Area Wetlands Ecosystem Goals Project (Goals Project)
4 was a 5-year volunteer collaborative effort completed in 1998. Sponsored by a
5 group of agencies that included EPA, DFG, and RWQCB, it involved more than
6 100 scientists from federal, state, and local agencies, as well as private consulting
7 firms and universities. The results of the Goals Project address a 9-county area
8 that encompasses the entire estuary downstream of the Delta.

9 The Goals Project is intended to provide guidance to public and private
10 stakeholders interested in restoring and enhancing the wetlands and related
11 habitats of the San Francisco Bay estuary system. It is an informational
12 document that recommends the types, areal extent, and distribution of habitats
13 needed to sustain diverse and healthy ecosystems in the San Francisco Bay
14 estuary. Recommendations are presented by region, subregion, and segment.
15 Region-wide goals include the restoration of large patches of tidal marsh
16 connected by corridors to enable the movement of small mammals and marsh-
17 dependent birds, the restoration of large complexes of salt ponds for the
18 management of shorebirds, and the expansion of large areas of managed marsh.
19 The BMKV and SLC sites are identified in this plan as key areas for tidal marsh
20 restoration.

21 **McAteer–Petris Act, San Francisco Bay Plan, and Coastal**
22 **Zone Management Act**

23 The McAteer–Petris Act, passed by the State of California in 1965, established
24 BCDC as the state agency responsible for regulating development in and around
25 San Francisco Bay and directed BCDC to undertake the planning effort that
26 resulted in the development of the San Francisco Bay Plan. The Bay Plan
27 describes the values associated with the Bay and presents policies and planning
28 maps to guide future uses of the Bay and its shoreline. Under the Bay Plan the
29 priorities for suitable uses of the shoreline are ports, water-related industry,
30 airports, wildlife refuges, and water-related recreation. The Bay Plan also
31 proposes to add land to the Bay refuge system; encourages public access via
32 marinas, waterfront parks, and beaches; and requires the provision of maximum
33 access along the Bay shorelines—except where public uses conflict with other
34 significant uses or where public use is inappropriate because of safety concerns.

35 The San Francisco Bay Plan was prepared to guide the future protection and use
36 of the San Francisco Bay and its shoreline. The Bay Plan maps designate the
37 HAAF and SLC sites for wildlife priority use and include a map note for the sites
38 that states that the Bay Plan policy is to: "...develop comprehensive wetlands
39 habitat plan and long-term management program for restoring and enhancing
40 wetlands habitat in diked former tidal wetlands. Dredged materials should be
41 used whenever feasible and environmentally acceptable to facilitate wetlands

1 restoration.” Furthermore, the BMKV expansion site is recommended for
2 “possible use as a wetland restoration site using dredged material.”

3 Specific key policies from the San Francisco Bay Plan that are applicable to the
4 proposed wetland restoration are listed below.

- 5 ■ To the greatest extent feasible, the Bay marshes, mudflats, and water surface
6 area and volume should be maintained and, whenever possible, increased.
7 Fresh water inflow into the Bay should be maintained at a level adequate to
8 protect Bay resources and beneficial uses. Bay water pollution should be
9 avoided (Policy 1 in Bay Plan Part III, Findings and Policies Concerning
10 Water Quality in the Bay).
- 11 ■ To assure the benefits of fish, other aquatic organisms and wildlife for future
12 generations, to the greatest extent feasible, the Bay’s tidal marshes, tidal
13 flats, and subtidal habitat should be conserved, restored, and increased
14 (Policy 1 in the Bay Plan Part III, Findings and Policies Concerning Fish,
15 Other Aquatic Organisms and Wildlife in the Bay).
- 16 ■ In reviewing or approving habitat restoration programs, BCDC should be
17 guided by the recommendations in the Baylands Ecosystem Habitat Goals
18 report and should, where appropriate, provide for a diversity of habitats to
19 enhance opportunities for a variety of associated native aquatic and terrestrial
20 plant and animal species (Policy 3 in the Bay Plan Part III, Findings and
21 Policies Concerning Fish, Other Aquatic Organisms and Wildlife in the Bay).
- 22 ■ The surface area of the Bay and the total volume of water should be kept as
23 large as possible in order to maximize active oxygen interchange, vigorous
24 circulation, and effective tidal action. Filling and diking that reduce surface
25 area and water volume should therefore be allowed only for purposes
26 providing substantial public benefits and only if there is no reasonable
27 alternative (Policy 1 in the Bay Plan Part III, Findings and Policies
28 Concerning Bay Water Surface Area and Volume).
- 29 ■ Where and whenever possible, former tidal marshes and tidal flats that have
30 been diked from the Bay should be restored to tidal action in order to replace
31 lost historic wetlands or should be managed to provide important Bay habitat
32 functions, such as resting, foraging, and breeding habitat for fish, other
33 aquatic organisms, and wildlife. As recommended in the Baylands
34 Ecosystem Habitat Goals report, around 65,000 acres of areas diked from the
35 Bay should be restored to tidal action. Further, local government land use
36 and tax policies should not lead to the conversion of these restorable lands to
37 uses that would preclude or deter potential restoration. The public should
38 make every effort to acquire these lands from willing sellers for the purpose
39 of restoration (Policy 4 in the Bay Plan Part III, Findings and Policies
40 Concerning Tidal Marshes and Tidal Flats Around the Bay).
- 41 ■ To ensure adequate capacity for necessary Bay dredging projects and to
42 protect Bay natural resources, acceptable non-tidal disposal sites should be
43 secured and the Deep Ocean Disposal Site should be maintained. Further,
44 dredging projects should maximize use of dredged material as a resource

1 consistent with protecting and enhancing Bay natural resources, such as
2 creating, enhancing, or restoring tidal and managed wetlands, creating and
3 maintaining levees and dikes, providing cover and sealing material for
4 sanitary landfills, and filling at approved construction sites (Policy 5 in the
5 Bay Plan, Part III, Findings and Policies Concerning Dredging in the Bay).

- 6 ■ Public access should be integrated early in the planning and design of Bay
7 habitat restoration projects to maximize public access opportunities and to
8 avoid significant adverse effects on wildlife (Policy 12 in the Bay Plan, Part
9 III, Findings and Policies Concerning Public Access to the Bay).

10 The federal Coastal Zone Management Act of 1972 encourages states to
11 voluntarily develop CMPs to preserve and protect the unique features of each
12 coastal area. BCDC is the state coastal management agency for the San
13 Francisco Bay segment of the coastal zone, and its laws and policies constitute
14 the federally approved state coastal management program for the Bay.

15 **Farmland Conservation Regulations**

16 Three major programs regulate or monitor the development and conversion of
17 farmlands in California. These are the federal Farmland Protection Policy Act
18 (FPPA), the state Farmland Mapping and Monitoring Program, and the
19 California Land Conservation Act (Williamson Act), which operates at the
20 county level. The following summarize key aspects of each program.

21 **Farmland Protection Policy Act**

22 The FPPA of 1984 requires federal agencies to consider how their activities or
23 responsibilities that involve financing or assisting construction of improvement
24 projects, or acquiring, managing, or disposing of federal land and facilities may
25 affect farmland. To comply with the provisions of the FPPA, the lead federal
26 agency must consult with the NRCS and complete a land evaluation and site
27 assessment (LESA) for each affected site or area. The federal lead agency is
28 responsible for coordinating completion of the Farmland Conversion Impact
29 Rating Form (Form AD-1006) with the NRCS.

30 Under the LESA system, proposed project sites receive scores based on several
31 criteria, including soil quality and existing land use. The highest possible score
32 for a site is 260 points. If a proposed federal action would affect a site that has
33 been rated with a score ≥ 160 , alternative sites should be considered.

34 **Farmland Mapping and Monitoring Program**

35 As part of its Farmland Mapping and Monitoring Program, the California
36 Department of Conservation (DOC) periodically prepares maps of important
37 farmlands for most of the state's agricultural areas. Preparation of these maps
38 follows DOC's Important Farmland Inventory (IFI) system, which relies on the
39 following sources of information.

- 40 ■ NRCS (formerly SCS) soil survey maps

- 1 ■ Land inventory and monitoring criteria developed by NRCS to characterize
2 the land's suitability for agricultural production, the physical and chemical
3 characteristics of its soil, and the actual (existing) land use
- 4 ■ Land use information mapped by the California Department of Water
5 Resources (DWR)
- 6 ■ Important farmland maps, typically updated every 2 years

7 The important farmland mapping system defines 4 categories of farmlands and 3
8 categories of lands used for non-agricultural purposes. Following are the 4
9 farmland mapping categories.

10 ***Prime Farmland*** – Lands with a combination of physical and chemical features
11 best able to sustain long-term production of agricultural crops. The land must be
12 supported by a developed supply of irrigation water that is dependable and of
13 adequate quality during the growing season. It must also have been used for the
14 production of irrigated crops at some time during the 4 years before mapping
15 data were collected.

16 ***Farmland of Statewide Importance*** – Lands with agricultural land use
17 characteristics, irrigation water supplies, and physical characteristics similar to
18 those of prime farmland but with minor shortcomings, such as steeper slopes or
19 soils that retain less moisture.

20 ***Unique Farmland*** – Lands with soils of lower quality used for the production of
21 California's leading agricultural cash crops. Unique farmlands are typically
22 irrigated but include non-irrigated orchards or vineyards in some of the state's
23 climatic zones.

24 ***Farmland of Local Importance*** – Lands of importance to the local agricultural
25 economy, as determined by each county's board of supervisors and a local
26 advisory committee.

27 **California Land Conservation Act (Williamson Act)**

28 The California Land Conservation Act (Williamson Act) is one of the state's
29 primary mechanisms for conserving farmland. This voluntary program is
30 administered at the county level and offers landowners property tax incentives to
31 maintain their lands in agriculture or other compatible uses. Under the
32 Williamson Act, private landowners may enter into a contract with their county,
33 limiting the use of their land to agriculture or other compatible use for a
34 minimum period of 10 years. In return, the county assesses the land at its
35 agricultural value rather than its fair market value. This limits property tax
36 increases that could otherwise arise from land speculation.

Land Uses, Zoning, Easement, Utilities, and Farmland Designations in the Expansion Area

Land Use and Zoning

The BMKV site consists of former baylands that were diked for agricultural use in the late 19th century. Recently, the majority of the site has been under cultivation for oat hay. Two fields were authorized in the 1980s for the placement of dredged materials and have subsequently been left fallow (figure 4-11).

The BMKV site is located within the City-Centered Corridor planning area of Marin County and is designated for agriculture and conservation use, with a permitted residential use of 1 unit per 2–10 acres (RSP 0.5).

The BMKV site is zoned within the Bayfront Conservation (BFC) Zone. This zone is intended to preserve, protect, and enhance existing species and habitat diversity in the county.

The majority of the proposed wetland restoration site is zoned BFC–RSP 0.5 (Bayfront Conservation – Residential, Single-Family Planned 1 unit/2 acres) and the remainder is zoned BFC–ARP 2 (Bayfront Conservation – Agricultural, Residential, Planned 1 unit/ 2 acres) (figure 4-12). Existing land use designations and zoning support agricultural and open space uses and restoration of agricultural land to wildlife habitat and/or wetlands. Planned single-family residential development with a density of 0.5 unit per acre is also permitted. However, in part because of the need to balance the requirements of the natural and built environments within the BFC Zone, the county does not guarantee approval of the maximum housing density permitted by existing zoning; actual approvals would be contingent on the results of environmental compliance documentation for proposed development projects (California State Coastal Conservancy and U.S. Army Corps of Engineers 1998).

Flood zoning is discussed separately above in the *Surface-Water Hydrology and Tidal Hydraulics* section.

Easements

Two utility easements cross the BMKV site. A 20-foot easement for the NSD outfall pipeline is located on the east side of the levee that separates the expansion site from the HAAF site. An easement for the PG&E transmission line and towers crosses the northern portion of the BMKV site, west and east of the BMK south lagoon.

BMK CSD has a number of easements on Conservancy-owned land. The Conservancy owns some of the land under the BMK south lagoon, including the land under the lock, and BMK CSD has easements for the drainage, navigation,

1 and maintenance associated with the lagoon proper. The restoration project
2 includes no actions on the lands under the south lagoon itself, so these easements
3 would not be affected.

4 BMK CSD also has an easement for maintenance of the south lagoon levee. This
5 100-foot easement allows access for the maintenance of the south lagoon.

6 Several drainage agreements held by MCFCWCD and one drainage agreements
7 held by BMK CSD are discussed separately in the *Surface-Water Hydrology and*
8 *Tidal Hydraulics* section.

9 **Utilities**

10 The utilities on the proposed wetland restoration site include 5 PG&E electric
11 transmission line towers and the NSD sewer line. The 5 electric transmission
12 line towers are located in the north-western and north-central portion of the
13 expansion site, adjacent to Novato Creek and are located within a 40-foot wide
14 easement. The NSD line is located on the BMKV side of the levee that separates
15 the expansion site from the HAAF site.

16 **Farmland Designations**

17 The BMKV site received a score of 53 under the LESA system, well below the
18 160 LESA score at which alternative sites should be considered, because the site
19 is poorly drained, has low fertility, and lacks a supply of irrigation water (San
20 Francisco International Airport 2001). The BMKV site has been identified as
21 farmland of local importance. The BMKV site is not currently under Williamson
22 Act contracts.

23 **Land Uses Adjacent to the Expansion Site**

24 **Bel Marin Keys Residential Community**

25 The marina residential area of BMK is located north of the expansion site and
26 includes approximately 700 single-family homes located along 2 managed
27 lagoons connected to Novato Creek by 2 locks (figure 4-11). The lagoons
28 provide opportunities for recreational water sports and berthing for private
29 watercraft. The south lagoon is contained by a levee located on property now
30 owned by the Conservancy. Part of the south lagoon channel and the lock
31 structure is also on lands owned by the Conservancy. The BMK CSD possesses
32 easements for maintenance of the lagoon levee and for navigation purposes
33 across the Conservancy-owned portions of the channel and lock. BMK boat
34 owners use Novato Creek to access the Bay. The south lagoon levee is used
35 informally by BMK residents and occasionally by other members of the public

1 for walking and dog walking. The levee is not a designated trail. The BMK
2 CSD easements for levee maintenance do not provide an entitlement for
3 recreational access or use of the south lagoon levee.

4 **Headquarters Hill**

5 Several private homes are located on Headquarters Hill adjacent to the northwest
6 corner of the expansion site and adjacent to Bel Marin Keys Boulevard
7 (figure 4-11). Headquarters Hill is not owned by the Conservancy and is not part
8 of the proposed expansion.

9 **Pacheco Pond**

10 Pacheco Pond is located west of the proposed expansion site. This 120-acre site
11 is a flood control reservoir that was constructed by the developer of the Ignacio
12 Business Park and was deeded to MCFCWCD as a detention basin for flows
13 from Pacheco Creek and Arroyo San Jose. Water from Pacheco Pond is
14 currently discharged to Novato Creek. The Ignacio Business Park, which is a
15 mixed-use office/light industrial/commercial development, is located west of
16 Pacheco Pond (figure 4-11).

17 **Novato Creek**

18 Novato Creek is used for navigation by boats that are docked in the Bel Marin
19 Keys south and north lagoons and can be used for recreation by boats that may
20 access the creek from San Pablo Bay. Novato Creek is designated as a navigable
21 water and a public way, from its mouth to Sweetzer's Landing, by the California
22 Harbors and Navigation Code Section 104.

23 The form of the Novato Creek channel has been significantly altered by
24 development in the lower watershed. Prior to agricultural development, the daily
25 flow of tides in approximately 3,500 acres of wetland in the lower watershed
26 maintained a much larger channel than currently exists. Since agricultural
27 development, the creek has been cut off from wetlands that provided a large part
28 of its tidal prism. Scouring flows have been reduced to approximately 3% of the
29 historical tidal flow rate, which has caused the channel to contract in depth and
30 associated cross-sectional area. To mitigate the effects of reduced channel depth
31 on navigation and flooding dynamics, sections of the lower reaches of Novato
32 Creek have been dredged. From the mid 1960s to the late 1980s, navigation
33 dredging by BMK CSD occurred on an approximately 10-year cycle. Within the
34 lower tidal reaches of Novato Creek (i.e., BMK region and downstream), tidal
35 conveyance represents the primary sediment source, delivering sediment to the
36 creek by flood tides that contain suspended sediment from San Pablo Bay.
37 Sedimentation rates and patterns in this reach are consistent with other tidally
38 influenced channels in the North Bay (Philip Williams and Associates 2002).

1 **Hamilton Army Air Field**

2 The former HAAF is located south of the proposed expansion site. HAAF was
3 decommissioned as an active Air Force facility in 1974. The parcel includes a
4 former runway, aprons, taxiways, a revetment area, an airplane hangar, and other
5 miscellaneous structures. The revetment area is located in the northeastern
6 corner of the revetment turnouts. The HWRP is currently being planned for this
7 site, in which tidal marsh and seasonal marsh will be restored (figure 4-11). The
8 adjacent Bulge parcel, currently owned by the City of Novato, is zoned for open
9 space and currently unutilized.

10 **State Lands Commission Parcel**

11 **Land Use**

12 The area that now makes up the SLC parcel was owned by the Air Force and was
13 operated as part of HAAF until 1974. While the base was active, the parcel
14 supported a variety of uses, including a rifle range, a pistol range, and antenna
15 facilities. It was also used at various times for skeet shooting and firefighter
16 training. Some infrastructure related to military uses remains onsite. When
17 HAAF was decommissioned, the State of California acquired the parcel and
18 leased a portion of the rifle range to the City of Novato for police small arms
19 training (California State Coastal Conservancy and U.S. Army Corps of
20 Engineers 1998). Antennas and associated cables are also located in the area.
21 Other facilities at the site include aboveground fuel tanks, transformers, target-
22 practice ranges previously used by the Novato Police Department, and burn pits.

23 The City of Novato General Plan designates the SLC parcel as open space. It
24 describes open space uses as “publicly-owned land that is largely unimproved
25 and devoted to the preservation of natural resources, outdoor recreation,
26 floodways and flood control, and the maintenance of public health and safety.”
27 The allowable uses within this land use category include uses devoted to the
28 preservation of natural resources.

29 The SLC parcel is also located within an area zoned by the general plan as the
30 Bayfront Area. The designated Bayfront Area was established to “preserve and
31 enhance natural and historic resources, including wildlife and aquatic habitats,
32 tidal marshes, seasonal marshes, lagoons, wetlands, agricultural lands, and low-
33 lying grasslands overlaying historic marshlands.”

34 **Utilities**

35 NSD has two 50-year easements on the SLC parcel: a 20-foot-wide easement for
36 the outfall pipeline; and an easement for the dechlorination plant, which is
37 located on the southern edge of the SLC parcel. Treated effluent is conveyed
38 from the Ignacio Treatment Plant and the Novato Treatment Plant to the
39 dechlorination plant through a 54-inch outfall force main located on the BMKV
40 and SCL parcels, parallel to the HAAF perimeter levee. The treated effluent is
41 dechlorinated and then discharged to San Pablo Bay. Power is supplied to the

1 dechlorination plant through an underground power line that runs from a
2 transformer at the perimeter ditch pump station along the outboard side of the
3 HAAF levee. Water is brought to the dechlorination plant in trucks and is stored
4 onsite. The HWRP would relocate the dechlorination plant to allow the wetland
5 restoration effort to proceed on the SLC parcel.

6 **Environmental Consequences and Mitigation** 7 **Measures**

8 **Approach and Methods**

9 Information related to land uses, utilities, and easements at the expansion site was
10 reviewed and compared to the restoration alternatives to evaluate the potential for
11 land use conflicts, disruption or loss of services provided by utilities, or conflicts
12 with easements. Potential impacts were compared to the thresholds of
13 significance described below to determine the level of significance of each
14 impact.

15 **Impact Mechanisms**

16 The following impact mechanisms would affect the land use of the expansion
17 site.

- 18 ■ Placing dredged material to create elevations suitable for tidal marsh
19 restoration
- 20 ■ Creating public access along the Bay Trail or spurs to the Bay Trail
- 21 ■ Breaching the perimeter levee of the site to restore tidal connection to the site
22 with San Pablo Bay and Novato Creek

23 **Thresholds of Significance**

24 The following significance criteria were used to evaluate the proposed BMKV
25 expansion. Regarding land use and utilities, the proposed expansion was
26 identified as resulting in a significant impact on the environment if it would

- 27 ■ conflict or be incompatible with the land use goals, objectives, or guidelines
28 of applicable general plans;
- 29 ■ be inconsistent or conflict with statutes of the California Coastal Act or the
30 land use goals, objectives, or policies of BCDC or other applicable state
31 agencies;
- 32 ■ substantially conflict with an existing onsite land use;

- 1 ■ substantially conflict with existing or future adjacent land uses;
- 2 ■ result in the loss of an existing easement or service to existing facilities;
- 3 ■ conflict with existing regional utility infrastructure; and
- 4 ■ convert a large amount of prime farmland, unique farmland, or farmland of
- 5 statewide importance to a non-compatible and/or non-agricultural use.

6 In general, permitted and adopted land uses in areas surrounding the expansion
7 area are compatible with habitat restoration. Consequently, implementation of
8 the habitat restoration is not generally expected to result in adverse effects on
9 existing or planned land uses adjacent to the proposed wetland restoration site.
10 However, habitat restoration would result in the impacts on land use described
11 below.

12 **Impacts and Mitigation Measures of No-Action** 13 **Alternative**

14 The No-Action Alternative would not result in any impacts to land uses on the
15 expansion site. The proposed wetland restoration site would continue to support
16 agricultural fields and utilities. The site would also continue to provide capacity
17 for floodwater overflows from Novato Creek and Pacheco Pond.

18 **Impacts and Mitigation Measures Common to** 19 **Alternatives 1–3**

20 **Impact LU-1: Consistency with Applicable City and** 21 **County General Plans and Policies**

22 The proposed wetland restoration is generally consistent with applicable county
23 policies that support the enhancement of the wildlife and aquatic habitat value of
24 the diked historic marshlands in the BFC Zone along San Pablo Bay. (A specific
25 land use policy consistency analysis for all policies described above in the
26 *Environmental Setting* is provided in appendix J. This impact analysis focuses
27 on the primary city, county, and other jurisdiction policies that would be affected
28 by implementation of the proposed wetland restoration.)

29 County Policy EQ-2.42 encourages the County to preserve and enhance the
30 diversity of wildlife and aquatic habitats found in bayfront lands. The proposed
31 wetland restoration would result in tidal wetland, other tidal habitats, seasonal
32 wetland, and upland habitat. Additionally, the project would preserve and
33 enhance the diversity of wildlife and aquatic habitats.

34 Policy EQ-2.45 encourages land uses that provide or protect wetland or wildlife
35 habitat, including restoration to tidal status and to seasonal wetlands, and

1 preserves non-native agricultural lands. However, the MCP does not weight or
2 give preference to any of these uses. It is not intended that each of these uses
3 must be a part of any restoration plan, but rather that these uses are acceptable
4 and compatible with the intent of the BFC Zone designation.

5 Some of the MCP policies (e.g. EQ-2.45) contain language discouraging any
6 filling within the BFC Zone, however the language referring to potential filling is
7 primarily in the context of fill for development, not for habitat enhancement.
8 Alternative 1 and Revised Alternative 2 would require the placement of dredged
9 material and all 3 alternatives would include construction of levees on the
10 BMKV site. While these activities might be considered “fill,” these activities are
11 only proposed in the overall purpose of enhancing the wildlife and aquatic habitat
12 value of the BMKV site and implementing the overall site design. Mitigation
13 measures described above in the *Biological Resources* section are proposed to
14 reduce adverse impacts resulting from such activities on existing habitat and the
15 project overall would increase substantially the amount of wetland habitat at the
16 site.

17 Implementation of any of restoration alternatives at the BMKV parcel would
18 result in conversion of the existing agricultural lands, which would be
19 inconsistent with MCP Policy EQ-2.58 and A-1.6. MCP Policy EQ-2.58
20 recognizes agricultural lands as important as a visual resource, as part of
21 agricultural and dairy operations, as a productive economic resource, and as
22 compatible with, and in some cases, providing wildlife habitat. The purpose of
23 MCP Policy A-1.6 is to minimize impacts to agricultural lands by preventing or
24 mitigating for the loss of productive agricultural land within the BFC Zone. As
25 discussed below in the *Visual Aesthetics* section of this chapter, the restoration of
26 tidal wetlands and other habitats on the site is expected to maintain or improve
27 the visual aesthetics of the BMKV site itself (although some alternatives would
28 result in partial obstruction of certain existing views). As described below under
29 impact LU-5, the agricultural land at the BMKV parcel is not designated prime
30 farmland, unique farmland, or farmland of statewide importance, is a small
31 portion of available Marin County agricultural land, and has not produced
32 substantial crops to support the local agriculture economy. While agricultural
33 land can be compatible with wildlife habitat, the restoration alternatives would
34 provide a significant enhancement of the wetland and aquatic habitat of the site
35 compared to the existing setting.

36 While the project would be inconsistent with EQ-2.58 and A-1.6 taken in
37 isolation, the project is considered overall to be consistent with the intent of the
38 County policies for the BFC Zone. The possibility of returning undeveloped
39 former marshes to more productive wildlife habitat by restoration is recognized
40 as a potential purpose of the diked bay marshland and agricultural subzone in the
41 MCP. Given the emphasis within County policies regarding enhancement of the
42 wildlife and aquatic habitat of diked historic marshlands, the restoration of the
43 site to habitats of higher quality and greater importance to the Novato Creek and
44 San Pablo Bay ecosystems than those present today would be a higher priority

1 use of the site than retaining the site in its current low-productivity agricultural
2 setting.

3 City of Novato policies would apply to portions of the Bay Trail located on City
4 or MCFCWCD land west of the HWRP and BMKV. The project in general is
5 consistent with the overall intent of city policies related to shoreline uses.
6 Discussion of the Bay Trail relative to land use is provided below under Impact
7 LU-2. Discussion of the Bay Trail relative to biology is provided in the
8 *Biological Resources* section of this chapter.

9 Overall the project is considered consistent with the intent of Marin County and
10 City of Novato general plan policies for the bayfront lands and the potential
11 inconsistencies noted above regarding fill and agriculture are considered less than
12 significant impacts.

13 Discussion of flood zoning is presented above in the *Surface Water Hydrology*
14 *and Tidal Hydraulics* section.

15 **Impact LU-2: Compatibility with Designated Bay Trail** 16 **Routes and Effects on Existing Informal Recreational Use**

17 As described previously in chapter 3, the proposed wetland restoration includes
18 extending the Bay Trail south from the City levee along the HWRP perimeter
19 levee, north from the City levee to Pacheco Pond, and then north to Bel Marin
20 Keys Boulevard. Each alternative also includes construction of an interpretive
21 center.

22 The unique portions of the Bay Trail routes and location of an interpretive center
23 for each restoration alternative are described below.

24 Under Alternative 1, the Bay Trail would be located along the western edge of
25 Pacheco Pond and connect to Bel Marin Keys Boulevard. The interpretive center
26 would be located south of the HWRP seasonal wetland area. Under Spur
27 Option 1A, a spur to the Bay Trail would extend from the west side of Pacheco
28 Pond to Novato Creek along existing and new levees constructed for the wetland
29 restoration.

30 Under Revised Alternative 2, the Bay Trail would be located along the eastern
31 edge of Pacheco Pond along the existing levee and connect to Bel Marin Keys
32 Boulevard around the western boundary of Headquarter Hill. The interpretive
33 center would be located west of the HAAF site on City of Novato property.
34 There would be no spur along existing or new levees from Pacheco Pond to
35 Novato Creek under Revised Alternative 2.

36 Under Alternative 3, the Bay Trail would be located along the eastern edge of the
37 expanded Pacheco Pond on the new levee and cross the BMKV site to Bel Marin
38 Keys Boulevard. The interpretive center would be located on the BMKV site.

1 Under Spur Option 3A, a spur to the Bay Trail would extend from the east side of
2 Pacheco Pond to Novato Creek along a new levee constructed immediately south
3 of the BMK south lagoon levee.

4 In general, the purpose of the Bay Trail Plan is to provide north-south access to
5 facilitate and create recreational opportunities associated with the Bay.
6 Alternatives 1-3, including both their common elements and their unique routes
7 to Bel Marin Keys Boulevard, are generally consistent with this purpose.
8 However, the Bay Trail proposed under Alternative 1 would not be consistent
9 with the preferred connector route, according to the existing Bay Trail Plan
10 (along the eastern edge of Pacheco Pond) or the City of Novato Plan because it
11 would require locating the Bay Trail along the western edge of Pacheco Pond.
12 Since the dominant interest concerning the Bay Trail is establishing a north-
13 south connection, the Alternative 1 routing is considered generally consistent
14 with existing plans, and the impact is considered less than significant. Revised
15 Alternative 2 is consistent with the current Bay Trail route proposed by the City
16 and County. Alternative 3 is generally consistent with the current proposed Bay
17 Trail route, although the last portion of the Bay Trail under this alternative goes
18 around the east side of Headquarters Hill, whereas the designated route goes
19 around the west side of Headquarters Hill.

20 Spur Options 1A and 3A are not envisioned in current planning for the Bay Trail.
21 However, construction of such spurs would not hinder the completion of a north-
22 south connector from HAAF to Bel Marin Keys Boulevard. Although not called
23 for in current Bay Trail planning, the spur options are not considered inconsistent
24 with existing plans. The spur options would place a public trail in proximity to
25 the BMK south lagoon, where no designated public trail currently exists. As
26 noted above, there is informal use at present of the south lagoon levee for
27 walking.

28 A number of community members in the BMK residential area raised concerns
29 about the proximity of the proposed spur trail under Alternatives 1 and 3 in
30 regards to noise, aesthetics, and security. Noise from foot traffic is not
31 considered a significant incompatibility with nearby residential use. Aesthetics
32 regarding the levee itself are discussed in the *Aesthetics* section below, but the
33 presence of additional pedestrians where there is already informal use by walkers
34 is not considered a significant effect. Regarding security, the BMK community
35 is accessible by public road at present. Any trail along the south lagoon levee or
36 along the new levee would not provide a new path of access into the community
37 because the lagoon itself separates the trail from the residences; therefore, this is
38 not considered a significant effect. Under Alternative 1, the trail would be located
39 approximately 1,000 feet south of the BMK south lagoon levee. Given the
40 distance from the BMK south lagoon, foot traffic along the trail spur is not
41 expected to result in a significant incompatibility with the BMK residential area.
42 The aesthetics of new levee construction in Alternative 1 are discussed separately
43 below in the *Aesthetics* section.

1 Under Alternative 3, the spur trail would be located on the new levee,
2 approximately 50 feet south of the BMK south lagoon levee. In some areas, the
3 trail would be approximately 150 to 200 feet from several houses in the eastern
4 part of BMK residential areas, located at the southern end of streets facing south
5 toward the south lagoon levee. This would result in additional noise from foot
6 traffic in this area and visibility, compared to Alternative 1. However, use of the
7 spur trail is expected to be infrequent and limited to foot traffic and would be
8 similar to the informal use at present, so noise or visual disruption from trail use
9 is not expected to result in significant disruption of adjacent residential uses.
10 Visual aesthetics of construction of the new levee itself under Alternative 3 are
11 discussed separately below in the *Aesthetics* section.

12 Regarding the informal use of the south lagoon levee for walking, Alternative 1
13 and Revised Alternative 2 would displace this use, while Alternative 3 would
14 convert this informal use into a publicly designated trail. Under Alternative 1,
15 the informal use would be displaced to a public trail along the new levee. Under
16 Revised Alternative 2, the informal use would be displaced to the Bay Trail, but
17 there would be no public access eastward to Novato Creek. Under Alternative 3,
18 the new designated trail would be just south of the existing levee. Under all 3
19 alternatives, with the implementation of recommended mitigation for
20 management of access effects on wildlife, no dogs would be allowed on the
21 BMKV site. The displacement of the existing informal use of the south lagoon
22 levee for walking is considered a less-than-significant land use impact because
23 the existing informal use is not on a publicly designated trail, the restoration
24 alternatives all provide for alternative public access trails that would connect
25 with regional trail systems, and access to the new trail(s) would be in proximity
26 to the BMK community. Prohibition of dogs is considered necessary for habitat
27 protection on the BMKV site but is not considered a significant land use impact
28 because of the informal nature of the current dog walking use, the level of
29 existing activity, and the existence of other designated public trail areas or other
30 areas in the vicinity to walk dogs.

31 **Impact LU-3: Conflict with Existing Utilities and Utility** 32 **Easements**

33 There are 5 electric transmission line towers and an NSD sewer line that are
34 located on the expansion site. The construction of the proposed BMKV
35 expansion has the potential to result in damage to the existing regional utilities
36 infrastructure, through the disruption of service from the electric transmission
37 lines and restricting access for maintenance activities. Prior to construction,
38 concrete casings would be installed on the footings of the electric transmission
39 line towers to prevent damage to the structures. Raised boardwalks would also
40 provide maintenance access to the electric transmission line towers from the
41 proposed flood protection levee and the existing Novato Creek levee. Service
42 would not be interrupted as a result of implementation of the proposed BMKV
43 expansion, and therefore there would be no impact on the electric transmission
44 line service.

1 Under all 3 alternatives, the new NSD sewer line would be installed adjacent to
2 the current alignment, except around Pacheco Pond. Under all 3 alternatives, a
3 new section of pipeline would be installed around the eastern side of the
4 expanded Pacheco Pond; under Revised Alternative 2, the expanded pond would
5 be about half the size it would be under the other 2 alternatives. Access would
6 continue to be provided by the berm that separates the expansion site from the
7 HAAF site. Service would not be interrupted as a result of implementation of the
8 proposed BMKV expansion under any of the alternatives, and therefore there
9 would be no impact on existing utility service.

10 Under all 3 alternatives, the proposed berm access trail between BMKV and
11 HAAF on the NSD line would be constructed at an elevation of 4 to 6 feet. If the
12 berm were constructed at 4 feet, the NSD line could not be accessed during all
13 weather conditions, as tidal overflow would cover the berm. If the berm were
14 constructed at 6 feet, all weather access would be possible, as tidal overflow at
15 this elevation is rare. This impact is considered less than significant.

16 **Impact LU-4: Conflict with Other Existing Easements**

17 In addition to the PG&E and NSD easements, the BMKV site is also subject to
18 the requirements of several drainage agreements with MCFCWCD and with
19 BMK CSD, as well as a maintenance agreement with BMK CSD for the BMK
20 south lagoon. The drainage agreements are discussed separately above in the
21 *Surface Water Hydrology and Tidal Hydraulics* section.

22 The easement for the maintenance of the south lagoon levee allows BMK CSD
23 access to the levee for maintenance. Under all alternatives, the BMK south
24 lagoon would be improved, which would result in the levee being increased to a
25 top height of approximately 6 feet NGVD. The current south lagoon levee
26 ranges in height from 2 to 5 feet NGVD. In addition to improving the south
27 lagoon levee, new water conveyance structures (Alternative 1 and Revised
28 Alternative 2) or pumps (Alternative 3) would be installed to facilitate flow from
29 the south lagoon to either a swale area or the tidal marsh restoration area. Access
30 would be provided under any alternative for maintenance of the lagoon or water
31 management structures.

32 The restoration alternatives are not expected to compromise the intent of the
33 existing easements related to the maintenance of the south lagoon levee or
34 overflow structure.

35 **Impact LU-5: Conversion of Prime Farmland, Unique 36 Farmland, or Farmland of Statewide Importance to Non- 37 Agricultural Use**

38 No prime farmland, unique farmland, or farmland of statewide importance would
39 be affected by habitat restoration on the BMKV site. The site currently supports

1 farmland of local importance. The total amount of land converted (1,241 acres)
2 would be small relative to the total area of land designated for agricultural use in
3 Marin County (167,000 acres) (San Francisco International Airport 2001).
4 Additionally, much of the site has remained fallow for many years, and therefore
5 the site has not produced substantial crops to support the local agriculture
6 economy. Consistency with Marin countywide policies regarding agriculture is
7 discussed above under Impact LU-1.

8 During the 1997 appraisal of the property by the Conservancy, the agricultural
9 potential of the expansion site was assessed and was not considered economically
10 sustainable because of poor drainage, low fertility, and lack of an irrigation
11 supply. Further, the Conservancy has also consulted with an agricultural advisor
12 at the Southern Sonoma-Marín Resource Conservation District (RCD) who stated
13 that the land was very poor quality for farming because of a number of factors,
14 including poor soil quality, poor drainage, and lack of water supply (Gustasson
15 pers. comm.).

16 The loss of agriculture at the expansion site is a less-than-significant impact
17 because the site is not prime farmland, unique farmland, or farmland of statewide
18 importance; agriculture is not considered economically sustainable onsite due to
19 the low quality of soils, poor drainage, and lack of irrigation water; and the site
20 plays a relatively limited role in the County and regional agricultural economy.
21 Further, because the project promotes habitat restoration and enhancement within
22 an area in the BFC Zone, the public values for which agriculture onsite was
23 previously considered valuable (namely open space, views, and habitat) are
24 preserved and/or enhanced by the proposed wetland restoration.

25 **Impacts and Mitigation Measures Unique to Alternative** 26 **1 and Revised Alternative 2**

27 **Impact LU-6: Modifications to Morphology of Novato** 28 **Creek due to Breach of BMKV/Novato Creek Levee May** 29 **Affect Navigation**

30 The conceptual design plans for Alternative 1 and Revised Alternative 2 include
31 a marsh basin connection to Novato Creek through a single levee breach. The
32 breach would be located at the downstream end of the creek, only a few thousand
33 feet from San Pablo Bay. Preliminary analysis of local scour from increased tidal
34 prism reveals a minor widening of the creek channel, between 10 and 40 feet, and
35 a minor deepening of the channel, approximately 0.5 to 1.0 feet, along the
36 approximately 4,000-foot portion of Novato Creek, downstream of the breach to
37 the mouth. The increase in tidal prism is also expected to cause additional
38 widening and a minor deepening of the subtidal channel of Novato Creek,
39 beyond the mouth. The locations of these morphological changes are shown in

1 figure 4-7 in the *Surface-Water Hydrology and Tidal Hydraulics* section, which
2 also discusses morphological effects in greater detail.

3 These changes in morphology of the lower portion of Novato Creek are expected
4 to occur directly adjacent to the existing main channel of Novato Creek, from the
5 breach to the mouth, and the subtidal channel, beyond the mouth. Because the
6 effect of adding tidal prism to this portion of the creek is a minor increase in
7 channel width and depth, these changes in morphology are not expected to have a
8 significant adverse effect on the navigability of Novato Creek. Since this portion
9 of Novato Creek presently requires maintenance dredging to provide adequate
10 channel size for boat passage, the addition of tidal prism is an incidental
11 beneficial effect of the project on navigability, although the authorized purpose
12 of this project is not navigation. It should be noted, however, that the potential
13 addition by the project of 400 to 600 acres of tidal prism to this portion of Novato
14 Creek is not expected to result in sufficient channel width or depth to eliminate
15 the need for future maintenance dredging.

16 **Impacts and Mitigation Measures Unique to** 17 **Alternative 3**

18 **Impact LU-7: Inconsistency with the Long-Term** 19 **Management Strategy Management Plan**

20 The BMKV site is one of the 22 existing and potential locations identified by the
21 LTMS Management Plan as possible reuse and upland placement areas for
22 materials dredged from San Francisco Bay. Because Alternative 3 relies on
23 natural sedimentation to establish suitable elevations for tidal marsh restoration,
24 this alternative would not assist in the implementation of the LTMS Management
25 Plan. The BMKV site contains approximately 13 million cubic yards of capacity
26 for dredged material reuse in wetland creation and, along with the Montezuma
27 and Skaggs Island sites, it is one of the largest potential reuse sites identified in
28 the LTMS management plan. The infrastructure for dredged material off-loading
29 is under construction at the HAAF site, adjacent to BMKV.

30 This impact is considered adverse because it may hinder the availability of
31 suitable reuse sites, thus potentially slowing the LTMS goal of decreasing in-Bay
32 disposal of dredged material over the next decade. No mitigation, short of
33 changing to an alternative that uses dredged material, is available to mitigate this
34 impact.

35 Whether this is an adverse impact depends on whether there are sufficient
36 approved reuse and upland placement sites available to accommodate reasonably
37 foreseeable maintenance dredging operations in San Francisco Bay, so as to
38 implement the reduction in Bay disposal volumes as envisioned in the LTMS
39 Management Plan. This determination is outside the scope of this study.

Hazardous Substances and Waste

Affected Environment

Data Sources

The information presented in this section is based on existing data and previous reports that apply to the proposed BMKV expansion site and the SLC site. Descriptions of hazardous materials investigations and cleanup refer to areas of concern within the BMKV and SLC parcels, as well as a small portion of a City of Novato property known as the “Bulge” parcel. Overview of current remedial status at the neighboring HAAF parcel is also briefly discussed for information purposes. Possible sources of introduced hazardous substances from fill materials are also described.

The primary sources of information used for this section include the following.

- *Hamilton Wetland Restoration Plan Final Environmental Impact Report/Environmental Impact Statement (EIR/EIS)* (Jones & Stokes 1998), and its sources
- *Bel Marin Keys Unit V Final EIR/EIS* (Environmental Science Associates 1993)
- *Phase I Environmental Assessment Bel Marin Keys Unit V* (Miller Pacific Engineering Group 1994)

23 **Regulatory Overview**

24 Several federal and state agencies have regulations that govern the use,
25 generation, transport, and disposal of hazardous substances. The principal
26 federal regulatory agency is the federal EPA. The primary California state
27 agency with similar authority and responsibility is the California EPA (Cal-
28 EPA), which may delegate enforcement authority to other local agencies that
29 have agreements with Cal-EPA. Hazardous materials and hazardous waste are
30 regulated by the Resource Conservation and Recovery Act (RCRA);
31 Comprehensive Environmental Response, Compensation and Liability Act
32 (CERCLA); CCR Title 26; and other relevant state and federal regulations.
33 Federal regulations applicable to hazardous substances are contained primarily in
34 Titles 29, 40, and 49 of the CFR. State regulations have been consolidated in
35 Title 26 of the CCR.

1

Bel Marin Keys Unit V Expansion Site

2
3
4
5
6

Cal-EPA/Department of Toxic Substances Control (DTSC) is the lead agency for regulatory enforcement and oversight of any potential cleanup activities at the BMKV site. The Conservancy, as the owner of the BMKV site, is the responsible party for implementing any assessment and required remedial activities at the BMKV site.

7

State Lands Commission Parcel

10
11
12
13
14
15
16
17
18

The SLC parcel is currently being remediated under the FUDS program. (In FUDS remedial documents, the SLC parcel is usually referred to as the North Antennae Field [NAF] site. In this document, the parcel is referred to as the SLC parcel because the State Lands Commission owns it.) FUDS is an element of the Defense Environmental Restoration Program (DERP) (10 USC 2701 et seq.). It requires remediation of contaminated sites consistent with CERCLA, with the objective of finding a timely, cost-effective way to reduce the risk to human health, safety, and the environment resulting from past activities of the Department of Defense. In regards to remedial activities, the SLC parcel is the responsibility of the Department of Defense under the FUDS process with the Corps as the administering agency.

19
20
21

All contaminants on the SLC parcel would be remediated to support reuse before ownership of the site is transferred (California State Coastal Conservancy and U.S. Army Corps of Engineers 1998).

27
28
29
30
31
32

The BMKV expansion makes no determinations whatsoever regarding potential remedial activities at the SLC parcel. The lead agencies of the BMKV expansion presume that the FUDS process will result in implementation of remedial approaches that provide cleanup of any contaminated sites on the SLC parcel to a condition suitable for the proposed wetland use. If the remedial determinations ultimately made through FUDS require changes in the wetland designs proposed for the SLC parcel, then the lead agencies will evaluate the potential effects of the changes and determine whether additional NEPA/CEQA compliance will be necessary for the affected portions of the HWRP. The lead agencies' presumption that the FUDS process will result in remedial activity that leaves the site suitable for the proposed wetland use is the basis for analysis in this document.

33

Hamilton Army Airfield Parcel

34
35
36
37
38
39

Remedial issues at the HAAF parcel (including the Navy Ballfields) are being addressed through the BRAC process. As stated above, remedial issues at the SLC parcel are being address through the FUDS remedial process. These processes were described in chapter 2. The BMKV expansion makes no determinations whatsoever regarding potential remedial activities at the HAAF parcel. The BMKV expansion also makes no changes in the wetland design on

1 the HAAF parcel, which was analyzed in the 1998 EIS/EIR for the HWRP. The
2 lead agencies of the BMKV expansion presume that the BRAC process will
3 result in implementation of remedial approaches that provide cleanup of any
4 contaminated sites on the HAAF parcel to a suitable condition for the proposed
5 wetlands reuse. If the remedial determinations ultimately made through BRAC
6 require changes in the wetland designs proposed for the HAAF parcel, then the
7 lead agencies will evaluate the potential effects of the changes and determine
8 whether additional NEPA/CEQA compliance will be necessary for the affected
9 portions of the HWRP. The U.S. Army is the implementing agency for the
10 BRAC process at HAAF. The U.S. Navy is the implementing agency for the
11 BRAC process at the Navy Ballfields site.

12 **City of Novato Bulge Parcel**

13 The BMKV expansion Alternative 1 and Revised Alternative 2 include an
14 interpretive center and an access area on the City of Novato property west of the
15 HAAF parcel and south of Ammo Hill. This property is about 7 acres and is
16 commonly referred to as the “Bulge” parcel. For this document, the Bulge is
17 defined by the federal property boundary on the east, the existing dirt roads on
18 the south and west, and the levee along Pacheco Pond on the north (see figure
19 1-1). The area identified in this document as the Bulge parcel does not include
20 any part of the “POL Area” to the south and west nor any part of Landfill 26 to
21 the west. The Bulge was part of the larger Ammo Hill parcel presently owned by
22 the City of Novato, and was transferred from the federal government to the City
23 of Novato as part of the Phase II GSA Sale Property in late 1999. Although the
24 statement of condition does not identify any remaining remedial action for the
25 Bulge parcel, it does note that any additional remedial action found to be
26 necessary after the transfer would be conducted by the federal government
27 through the Department of Defense (U.S. Army Corps of Engineers 1999).

28 **Chemical Suitability of Dredged Material**

29 In the San Francisco Bay region, a consortium of regulatory agencies has been
30 established to address the long-term management of disposal of dredged
31 materials from the Bay. The LTMS agencies—the Corps, EPA, San Francisco
32 Bay RWQCB, BCDC, and SLC—have established a DMMO. The DMMO
33 evaluates dredged material and makes recommendations on its chemical and
34 biological suitability for reuse in wetlands based on testing specific to the
35 proposed site environment and criteria from federal and state laws and guidance
36 documents.

37 Regional testing guidelines for dredged material are described in Corps Public
38 Notice 01-01, “Proposed Guidelines for Implementing the Inland Testing Manual
39 Within the USACE San Francisco District,” and Public Notice 99-4, “Proposed
40 Guidance for Sampling and Analysis Plans (Quality Assurance Project Plans) for
41 Dredging Projects Within the USACE San Francisco District.” The RWQCB has

1 also developed criteria for evaluating the chemical suitability of dredged material
2 for use in tidal and seasonal wetland restoration projects, upland habitat creation,
3 and other upland uses. These criteria are found in the “Interim Sediment
4 Screening Criteria and Testing Requirements for Wetland Creation and Upland
5 Beneficial Reuse” (Wolfenden and Carlin 1992). The RWQCB is currently
6 considering an update of these criteria (San Francisco Regional Water Quality
7 Control Board 2000a). In addition, the RWQCB has prepared a TMDL report for
8 mercury in San Francisco Bay, but the TMDL has not yet been formally adopted
9 (San Francisco Regional Water Quality Control Board 2000b).

10 **Source Areas of Hazardous Substances and Waste**

11 The source areas where previous operations or activities may have generated
12 hazardous substances and/or wastes within the BMKV site are described below.
13 Contaminants identified or potentially present and the current remedial status of
14 the SLC and HAAF sites (which are part of the authorized HWRP) are also
15 described below, as is the City of Novato Bulge parcel.

16 **Bel Marin Keys Unit V Expansion Site**

17 Blymyer Engineers Inc. completed a previous environmental site assessment in
18 1989. The assessment performed shallow-soil sampling tests along the HAAF
19 property boundary and on the BMKV parcel itself to test for petroleum
20 hydrocarbons and herbicides/pesticides. The soil-sampling results showed that
21 no detection of herbicide/pesticide compounds or petroleum hydrocarbons were
22 present at the sampling locations (Miller Pacific Engineering Group 1994).

23 A Phase I Environmental Site Assessment and a Shallow Soil Investigation were
24 completed in 1994 and 2002, respectively, for the proposed BMKV expansion
25 site. The Phase I assessment identified several items that warranted further
26 attention (Miller Pacific Engineering Group 1994). The Shallow Soil
27 Investigation revealed several source areas on the BMKV site that exhibited low-
28 level contamination due to the presence of various hazardous substances and/or
29 waste (Erlor and Kalinowski 2002). The range of contamination for each type of
30 hazardous substance identified in the Shallow Soil Investigation was generally
31 below concentrations as established by the EPA Region IX Preliminary
32 Remediation Goals (PRGs) for residential soil. The results of the Phase I and
33 Shallow Soil studies are summarized in table 4-8. Figure 4-13 illustrates
34 potential areas of concern and sampling locations on the BMKV site, identified
35 in the Phase I and the Shallow Soil studies.

36 Sediments dredged from the BMK lagoon and possibly Novato Creek were
37 placed on a field in the northeast corner of the BMKV expansion site in the late
38 1980s. This soil was sampled in 2000 for mercury content. The results are
39 presented in the table 4-9 below. The range of concentrations identified is below

Table 4-8. Results of Phase I Environmental Site Assessment and Phase II Shallow Soil Investigation for the BMKV Expansion Site

Source	Potential Contaminant(s)	Results ⁽¹⁾
Concrete storage tank pads and dispenser (remnant piping) associated with a potential underground storage tank	Fuel	No observed indicators of prior spills or releases (Phase I) Metals detected in soil samples but at concentrations less than the EPA Region IX PRG for residential soil ⁽²⁾ ; TPH as diesel detected in soil (Phase II)
Two 55-gallon metal drums	Unidentified liquid	Unidentified liquid visually observed (Phase I)
Several old, inoperative pieces of farm equipment	Vehicle related fluid ground stain	Visually observed fluid leakage (Phase I)
West barn area	Pesticides	DDT detected in soil samples but at concentrations less than the EPA Region IX PRG for residential soil; dioxins and furans detected in soil but at concentrations less than the ATSDR ⁽³⁾ screening level (Phase II)
East barn area	Pesticides	DDT detected in soil samples but at concentrations less than the EPA Region IX PRG for residential soil; dioxins and furans detected in soil but at concentrations less than the ATSDR screening level (Phase II)
Debris pile (150 ft x 30 ft)	Glass bottles, car tires, washing machines, water heaters, engine parts, cans etc.	No obvious hazardous materials were observed at the debris pile (Phase I) DDT and its breakdown products (DDD and DDE) detected, but at concentrations less than the EPA Region IX PRG for residential soil; lead (650 mg/kg) and arsenic (36 mg/kg) were the only metals detected in soil samples at concentrations greater than the EPA Region IX PRG for residential soil (Phase II)
Crop duster area	Pesticides, herbicides	None detected in soil samples (Phase II)
Drainage ditches/field	Organic compounds	Dioxins and furans detected in soil samples, but at concentrations less than the ATSDR screening level (Phase II)
East levee pump station intake piping that extends into the drainage ditch	Oils	Lubricant oil staining was visually observed on the piping (Phase I)
<u>Possible septic tank/leach field</u>	Septic/household	Presence unknown (Phase I)

Notes:

⁽¹⁾ Phase I refers to the Phase I site investigation conducted by Miller Pacific Engineering Group in 1994, Phase II refers to the Phase II soil investigation conducted by Erler and Kalinowski, Inc. in 2002. Sources that were investigated in each study may or may not overlap depending on the defined source areas of investigation in each report, which were developed independently.

5 State Lands Commission Parcel

6 The area known as the SLC parcel was transferred to the SLC in 1974 when the
7 Air Force began to relinquish control of the Hamilton property. When the base
8 was active, the parcel supported a variety of uses, including a rifle range, pistol
9 range, and antenna facilities. It was also used at various times for skeet shooting
10 and fire-fighting training. The parcel currently contains antennas and associated
11 cable, aboveground storage tanks, transformers, burn pits, and target practice
12 facilities. A Phase II Site Investigation Report for the SLC site was completed in
13 April 2000 (IT Corporation 2000). The report identified the type and source of
14 contaminants that could potentially be present at the site. The results of the
15 investigation were used to supplement the 1998 initial site investigation results
16 (IT Corporation 2000) for risk evaluation, remedial action planning, and eventual
17 property closure. Six areas were investigated in further detail based on the initial
18 site investigation results.

19 The *Remedial Investigation Report* for the SLC parcel was completed in 2001
20 (Shaw Environmental & Infrastructure 2001). The goal of the investigation was
21 to characterize the nature and extent of contamination resulting from military
22 activities. The *Remedial Investigation Report* was a continuance of previous
23 efforts mentioned above, but it also included recent investigations conducted
24 between July 2000 and August 2001. Groundwater, soil, and sediment samples
25 were taken from 13 areas on the SLC parcel. A summary of the report findings is
26 provided below in table 4-10. Figure 4-14 illustrates potential areas of concern
27 on the SLC parcel identified in the report. The next phase of the remedial
28 process is the risk assessment and feasibility study phase, which will evaluate
29 data from the remedial investigation to determine risks posed to human health
30 and the environment and to determine the most appropriate remedial options for
31 the site that are suitable for the intended wetlands use.

Table 4-10. Summary of Draft Remedial Investigation Findings for SLC Parcel

Source Area	Potential Contaminant(s)	Discussion
Coastal Salt Marsh	Lead, other metals associated with ammunition, petroleum hydrocarbons	The estimated area of impact due to lead (9.5 acres) is confined to an area from east of the Small Arms Area to the Abandoned Automobile Area.
Drainage Ditches	Metals, JP-4, insecticides, and herbicides.	All detected at low concentrations. Insecticides and herbicides were detected at trace concentrations.
Antenna Installations	Polychlorinated biphenyls (PCBs)	Two reservoirs of dielectric fluid were found. The first reservoir had PCB levels below the detection limit. The second reservoir was dry and not tested.
Rifle Range	Lead, other metals associated with ammunition, petroleum hydrocarbons	Accumulated between the firing line and the Coastal Levee, with the highest concentrations found at the base of the Coastal Levee behind the target area impact berm.
Trap and Skeet Range	Lead and polynuclear aromatic hydrocarbons (PAHs)	Lead concentrations highest at 350 ft. to 700 ft. from the range fan. Highest PAH concentrations located where clay target fragments were evident; where clay target fragments were found in low quantities or not found, PAHs were either low or not detected.
Pistol and Night Firing Range	Chromium, copper, lead, nickel, and zinc	Contamination is assumed to be associated with site's use for target practice.
Abandoned Automobile Area	Lead and petroleum hydrocarbons	Degraded petroleum hydrocarbon products in diesel range were detected at a maximum concentration of 220 mg/kg. JP-4 was also detected in 2 samples at maximum value of 0.093 mg/kg.
Levee Berm Area	Lead	Lead impacted area begins from the firing line and extends east toward the coastal levee.
Fire Practice Area	PAHs, metals, petroleum hydrocarbons, volatile organic compounds (VOCs), dioxin/furans, and insecticides	Contaminants found throughout the site. There is no spatial distribution associated with the contaminants.
Rifle Range Road	Petroleum hydrocarbons, metals, and dioxin/furans	Concentrations of diesel, motor oil, and JP-4 have been detected in the soil surrounding aboveground storage tanks. The estimated volume of petroleum hydrocarbons in the soil is approximately 7,200 cubic yards.
Support Facilities	Petroleum hydrocarbons	Petroleum hydrocarbons were detected in the soils surrounding aboveground storage tanks and in trace concentrations in the septic system.
Western Property Boundary Area	Petroleum hydrocarbons, dioxin/furans, metals, PAHs, and insecticides	Concentrations of petroleum hydrocarbons, dioxins, metals, PAHs, and insecticides are present in the soil. Most constituents were either below detection limits or at concentrations within the range of Investigation Comparison Levels

Source: Shaw Environmental & Infrastructure 2001.

Hamilton Army Airfield Parcel

An airfield was in operation at Hamilton from 1933 to 1974. During its operation, it was used as a base for fighter squadrons and bombers and was also used as a training installation. The Air Force began to relinquish control of the property in 1974 when Hamilton Air Force Base was listed as excess property. In 1976, the State of California claimed land subject to tidal action on the Hamilton site as state property, and in 1984, the state acquired portions of Hamilton east of the outboard levees. Also in 1984, Hamilton was transferred to the Army and renamed Hamilton Army Airfield (HAAF). At that time, land not needed for military air operations was turned over for public sale. In 1988, the BRAC Commission recommended the closure of HAAF. In 1994, aircraft operations ceased and the airfield was closed (CH2M Hill 2001).

As part of the BRAC process, remedial efforts are being conducted at HAAF under a sequence of regulatory phases. The Army identified the nature and extent of contamination during a series of assessments and investigations culminating in the *Comprehensive Remedial Investigation Report* (IT Corporation 1999a). According to the report, a variety of military facilities and functions occurred at Hamilton that could potentially have resulted in soil contamination, including underground storage tanks; aboveground storage tanks; transformers and transformer pads; aircraft maintenance and storage; storm drain and sanitary sewer systems; a former sewage treatment plant; a pump station; fuel lines; revetment areas; construction debris disposal areas; and the perimeter drainage ditch (PDD), which collected runoff from the base and surrounding areas. Based on historical investigation, the contaminants detected at various sites on the Hamilton property include total petroleum hydrocarbons (diesel, gasoline, JP-4, or motor oil), metals, dioxins and furans, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) including polynuclear aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and pesticides (IT Corporation 1999a).

Remedial sites at the HAAF include 58 inboard sites inland of the eastern perimeter levee and 5 coastal salt marsh sites bayward of the perimeter levee. Between 1998 and 1999, interim removal actions were completed on many of the sites where elevated levels of contaminants had been found. A detailed description of site investigation and remedial investigation activities is provided in the *Comprehensive Remedial Investigation Report* (IT Corporation 1999a), interim removal action reports (IT Corporation 1999b and IT Corporation 2000), and the Remedial Design Report (Foster-Wheeler 2000). A human health and ecological risk assessment was completed for both the inboard and the coastal marsh sites in 2001 (IT Corporation 2001). The *Inboard Area Focused Feasibility Study Report* (FFS) was also completed in 2001 for the inboard area of HAAF (CH2M Hill 2001). The purpose of the FFS was to identify areas that required further remedial action and to develop, evaluate, and recommend remedial alternatives for these sites to protect human health and the environment in light of the proposed wetland restoration reuse. All of the inboard sites was investigated during the comprehensive remedial investigation and the risk

1 assessment. The FFS provides a description of each site based on those
2 investigations, and recommends 1 of the following 4 possible remedial
3 alternatives for each site.

- 4 ■ No Further Action—Maintain the property and provide controls, for a
5 prescribed time frame, to prevent access to the area.
- 6 ■ Institutional Controls—Implement non-engineering, legal measures that limit
7 exposure to hazardous substances by restricting land and/or water use.
- 8 ■ Excavation and Offsite Disposal—Remove contaminated soils and ship
9 offsite; backfill excavated area with certified clean fill.
- 10 ■ Excavation and Onsite Disposal—Excavate and remove contaminated soil;
11 transport excavated soils to onsite consolidation site and cap (CH2M Hill
12 2001).

13 For detailed discussion of each site and a description of interim remedial actions
14 completed and recommended alternatives, please refer to the *Comprehensive*
15 *Remedial Investigation Report* and *Inboard Area Focused Feasibility Study*
16 *Report* (IT Corporation 1999a; CH2M Hill 2001).

17 A draft feasibility study for the coastal salt marsh sites is currently in regulatory
18 review (Keller pers. comm.)

19 In 2001, the Corps, St. Louis District, completed an Archives Search Report
20 (ASR) for the HAAF parcel. The ASR reviewed historical information
21 concerning site use. The ASR did not identify any new areas of concern beyond
22 those currently being addressed by the BRAC process and recommended no
23 further actions beyond the continuation of the remedial processes already
24 underway (U.S. Army Corps of Engineers 2001). Because of DTSC and local
25 community group concern, the Army agreed to evaluate whether any of the areas
26 in the ASR warranted further investigation (Keller pers. comm.).

27 Several other issues related to residual contamination have also been identified
28 within the inboard areas at HAAF, including residual installation-wide pesticides
29 and PAHs in soil near the runway. The Army has identified these issues as not
30 being CERCLA releases, and they are not addressed in the comprehensive
31 remedial investigation or the FFS (see discussion below). However, DTSC
32 believes that these issues are releases under CERCLA. The Army agreed to
33 develop options in the Record of Decision Remedial Action Plan (ROD/RAP) to
34 address potential threats to human health or the environment in light of the future
35 proposed wetland reuse (CH2M Hill 2001).

36 The next step in the BRAC remedial process for HAAF is development of the
37 ROD/RAP. The Army released a draft final ROD/RAP in 2001. The ROD/RAP
38 certifies that the selected remedy complies with CERCLA, outlines the technical
39 goal of the remedy, provides background information on the site, summarizes the
40 analysis of alternatives, and explains the rationale for the selection of the remedy.

1 Following the ROD/RAP is the Remedial Design/Remedial Action phase, which
2 is the phase that designs and implements the remedy selected in the ROD/RAP.

3 **City of Novato Bulge Parcel**

4 The proposed location of the interpretive center and access area under
5 Alternative 1 and Revised Alternative 2 is in the center of the Bulge parcel, in the
6 concrete and grassland area between the seasonal wetlands to the north and south
7 (see figures 3-1 and 3-5). No wetland restoration is proposed on this property
8 since it is outside the HWRP boundary.

9 The Bulge area was reviewed in the remedial investigations conducted for the
10 GSA Phase II Sale Area as well as in the *Comprehensive Remedial Investigation*
11 *Report*. The Preliminary Assessment for the GSA Phase II Sale Area identified
12 three buildings in the Bulge area, an electrical power station (building 747), a
13 sentry station (Building 748), and a former ready hanger (Building 750) (IT
14 1996). According to the *Comprehensive Remedial Investigation Report*, the only
15 operations or activities known to have occurred in the area are aircraft takeoff
16 and landing (IT Corporation 1999a). The buildings have all been removed.

17 No concerns were identified in relation to Buildings 747 and 748. Two
18 underground diesel storage tanks were identified in association with Building
19 750. The tanks were removed along with contaminated soil in 1987. Subsequent
20 sampling was conducted during a 1997 site investigation. A risk assessment for
21 the site determined that the residual petroleum hydrocarbons in the soil (at 10
22 feet deep) do not present unacceptable risks. In the Remedial Action Plan
23 (RAP), in relation to the former underground storage tanks, the interim removal
24 action at this location was found to have provided protection of human health and
25 the environment. Continued monitoring of groundwater was recommended in
26 the RAP (IT 1998).

27 Soil sampling conducted as part of the BRAC remedial process in 1996 identified
28 metals in some samples above baseline values and detected DDE (a breakdown
29 product of DDT) in 2 samples (IT Corporation 1999a). The risk assessment
30 determined that risks to recreational users of the grassland or seasonal wetlands
31 were low related to these results (IT Corporation 2001).

32 The Statement of Transfer for the Ammo Hill parcel, of which the Bulge parcel is
33 a part, identified that all hazardous substances previously stored on the property
34 had been removed, and determined that all identified releases of hazardous
35 substances on the property had been assessed and appropriately remediated to
36 levels that do not pose a threat to human health or the environment. The
37 Statement of Transfer did not identify any further remedial actions for the area
38 within the Bulge property, as it is defined in this document. (U.S. Army Corps of
39 Engineers 1999.)

Sediment Quality

Dredged Material

An estimated 5,000–40,000 tons of contaminants, comprising at least 65 types of materials, are deposited in San Francisco Bay annually. These contaminants include trace elements such as copper, nickel, silver, zinc, and synthetic organic compounds (e.g., organochlorine pesticides, PCBs, and PAHs). The contaminants originate with numerous industrial, agricultural, natural, and domestic activities and reach the estuary through various means, such as river flow, storm drains, discharges from maritime vessels, and disposal of dredged materials. Many persistent contaminants become bound to particulate matter and accumulate in areas of sediment deposition. Once these contaminants enter the Bay and estuary, their fate is determined by a combination of physical, chemical, and biological processes (U.S. Army Corps of Engineers 1994).

The processes of dredging and placement of dredged materials in San Francisco Bay or in environments such as the proposed expansion site may disturb and redistribute contaminants that have been buried or otherwise sequestered in the sediments. These contaminants, once disturbed, may become biologically available in sediments and water at the site and exert toxic effects upon organisms that come in contact with them. The behavior of contaminants associated with sediments is difficult to predict but is influenced by temperature, amount of oxygen available, degree of acidity, sediment organic-carbon content, salinity, and biological activity. The specific characteristics of each environment in which sediments are deposited will determine the mobility and toxicity of the contaminants and, in turn, the way in which those contaminants can affect organisms.

Dredged material may originate from many sources, including the Port of Oakland 50-foot Deepening Project, Corps operations and maintenance dredging program; and other non-federal dredging projects.

Each dredging project requires a dredging permit, and the quality of sediments is reviewed as part of each permit application by the RWQCB, EPA, and, for nonfederal projects, the Corps. Sufficient data are available to identify, in general terms, the chemical constituents that may be present in dredged sediments from the various potential source locations around the Bay (U.S. Army Corps of Engineers 1994.).

As stated previously, the suitability of dredged material for the expansion site would be determined through the existing testing and suitability framework used by the state and federal agencies charged with approving placement of material dredged from San Francisco Bay through the DMMO. The agencies require dredging project applicants to sample and test sediments proposed to be dredged for chemical constituents of concern and for toxicity, using protocols acceptable to the agencies. The adequacy of the sampling and testing is evaluated by the DMMO, which then reviews the test results to evaluate the acceptability of the dredged material for placement at proposed sites in the Bay, ocean, wetland, or upland environments.

1 To aid in determining the suitability of dredged material for use in wetland
2 environments, the RWQCB has developed guidelines, known as the Wolfenden
3 and Carlin Guidelines (Wolfenden and Carlin 1992), that identify screening
4 criteria for contaminant levels for use in wetland projects. The RWQCB is
5 currently considering an update of these screening criteria to include the results
6 of recent ambient sediment sampling and other sediment studies (Regional Water
7 Quality Control Board 2000a). The DMMO would use these guidelines to assess
8 any dredged material proposed for use at the expansion site.

9 Two types of material may be placed at upland/bayland sites and used for
10 wetland creation or restoration, based generally on the concentration of particular
11 contaminants and the results of bioassays. These materials are described below.

12 ■ Cover sediments are those that would pass leaching and bioassay tests and
13 contain certain contaminants at concentrations less than those specified in the
14 RWQCB's interim screening criteria. The interim screening criteria are
15 shown in table 4-11 compared to ambient-level thresholds of the same
16 contaminants in the Bay. New draft screening criteria for cover material
17 proposed in 2000 are, for the most part, based on ambient thresholds. Cover
18 material can be used in wetland creation and restoration areas, for levee
19 construction, and for covering noncover materials. DMMO may also take
20 into account local ambient sediment quality when considering site-specific
21 determinations for locally appropriate cover criteria.

22 ■ Noncover sediments are those that pass leaching tests and have contaminant
23 concentrations that exceed criteria for cover sediments, but do not exceed the
24 criteria for noncover sediments. Noncover material must be covered on the
25 top and sides by a minimum of 3 feet of cover material or material native to
26 the site.

11

Although the current and draft screening criteria specify slightly differing guidelines for cover material (which can be used anywhere in a wetland) and noncover material (which needs to be properly buried), only material appropriate for cover, as determined by the DMMO, would be accepted for use at the expansion site. Separate tests for contaminant leaching are used to evaluate the acceptability of material for upland disposal. Only material found suitable by the DMMO would be used as part of the upland components of the proposed BMKV expansion.

**Mercury Concentrations in Novato Creek and San Pablo Bay
Sediments**

Because the restoration alternatives include breaches to San Pablo Bay and Novato Creek and would either rely on natural sedimentation for wetland formation or receive natural sedimentation after deposition of dredged material, sediments from the adjacent portions of San Pablo Bay and Novato Creek would be deposited within parts of the wetland restoration site. As described above, in general for San Francisco Bay sediments, a variety of natural and anthropogenic sources of chemical constituents have influenced the sediment chemistry of Novato Creek. Mercury has been identified as a constituent of concern in San Pablo Bay and in Novato Creek.

Sediment sampling was conducted by the BMK CSD in 1996, including samples collected from Novato Creek just north of the BMKV site. With the exception of mercury, all of the metals detected in the samples were at concentrations below the 1992 interim sediment screening criteria. Mercury was detected in a composite of the 2 Novato Creek sediment samples at concentration (0.74 mg/kg, dry weight) above the RWQCB current and proposed wetland cover screening criteria (Advanced Biological Testing 1997).

Sediment sampling was also conducted by the BMK Homeowners Association concerning mercury in sediments in Novato Creek (Advanced Biological Testing 2000). Some of the sediments exceed the RWQCB current and proposed wetland cover screening criteria for mercury. The results are summarized in table 4-12 below.

Table 4-12. Results of Novato Creek Sampling (2000)

	Mercury (mg/kg, dry weight)		Methylmercury (mg/kg)	
	Range	Average	Range	Average
Sediments (0–6")	0.273–0.479	0.384	0.001–0.0228	0.011
Sediments (6–12")	0.348–0.511	0.424	0.0011–0.0261	0.008
Sediments (12–18")	0.338–0.506	0.397	0.0017–0.0434	0.014

Samples collected from north of BMKV near mouth of creek and from upstream/downstream of Hwy 37.

Source: Advanced Biological Testing, Inc, April 25, 2000

The San Francisco RWQCB has analyzed ambient conditions throughout San Francisco Bay, including San Pablo Bay. The results for mercury are summarized in table 4-13 below. The reference site results for San Pablo Bay indicate that mercury concentrations meet the current and proposed RWQCB screening criteria for wetland cover.

2
3 In June 2002, the BMK CSD sampled sediment from the Bel Marin Keys north
4 lagoon and Novato Creek. Sediment and elutriate samples were analyzed for
5 mercury content. Results from the sediment analyses indicated mercury
6 concentrations ranging from 0.31 to 0.37 mg/kg dry weight (MEC 2002).
7 Reference site (sometimes referred to as a “background” site) sampling results for
8 mercury in San Pablo Bay are noted in table 4-13. The ambient level threshold
9 for mercury for fine grain sediments in the San Francisco Bay, as noted in table
10 4-12, is 0.43 mg/kg (San Francisco Regional Water Quality Control Board 1998).
11 The elutriate analyses showed mercury concentrations ranging from 4.78 and
12 6.71 nanograms/liter (ng/L) (MEC 2002). The RWQCB mercury water quality
13 objective for mercury is 25 ng/L (San Francisco Regional Water Quality Control
14 Board 1995). The Corps and Conservancy are not making any determinations at
15 this time regarding the suitability of dredged material proposed for use at the
16 BMKV expansion. That determination would be made by the DMMO. As noted
17 above, the purpose of the DMMO is to cooperatively review sediment quality
18 sampling plans, analyze the results of sediment quality sampling and make
19 suitability determinations for material proposed for disposal in San Francisco
20 Bay, including proposals for reuse in wetland restoration. Also, as noted above,
21 DMMO may take into account local (e.g. Novato Creek or San Pablo Bay)
22 ambient conditions when making determinations of appropriate criteria for
23 wetland criteria.

24 **Environmental Consequences and Mitigation**
25 **Measures**

26 **Approach and Methods**

27 The approach and methods used to evaluate hazardous substances and waste
28 consisted of reviewing available reports regarding potential contaminants present
29 at the site. In addition, data were reviewed regarding contaminant concentrations
30 in potential dredged material proposed for reuse at the site. Potential impacts on
31 public health from the release of onsite or imported contaminants were reviewed,
32 including an assessment of toxicity and potential exposure pathways.

1 **Thresholds of Significance**

2 The following significance criteria were used to evaluate the proposed BMKV
3 expansion. Regarding hazardous substances and waste, the proposed expansion
4 was identified as resulting in a significant impact on the environment if it would

- 5 ■ create a potential public health hazard; or
- 6 ■ involve the release of onsite contaminants or imported contaminants that
7 pose a hazard to human, animal, or plant populations in the area affected.

8 **Impacts and Mitigation Measures of No-Action** 9 **Alternative**

10 No new impacts related to hazardous waste would occur under the No-Action
11 Alternative. Regardless of final disposition of the proposed wetland site,
12 identification, remediation, and/or disposal of hazardous waste would be
13 performed as necessary by the Conservancy in accordance with appropriate local,
14 state, and federal regulations. The required level of remediation, however, may
15 vary based on the selected final use of the expansion area. With no BMKV
16 expansion, the HWRP would proceed as proposed on the HAAF and SLC parcels
17 only. Thus, the BRAC and FUDS processes would continue to consider the
18 future proposed wetlands use at the HAAF and SLC parcels.

19 No impacts associated with sediment quality would occur because no dredged
20 material would be imported onto the BMKV or SLC parcels.

21 **Impacts and Mitigation Measures Common to** 22 **Alternatives 1–3**

23 **Impact HAZ-1: Potential Exposure of Humans, Plants, or** 24 **Wildlife to Contaminants as a Result of Remediation** 25 **Activities for the Proposed Action**

26 The lead agencies are required to perform appropriate cleanup of all hazardous
27 waste sites located on the BMKV site, as well as on the SLC and HAAF sites
28 (which are part of the authorized HWRP) in accordance with RCRA, CERCLA,
29 CCR Title 26, and other applicable local, state, and federal regulations.

30 The BMKV expansion makes no determinations whatsoever regarding potential
31 remedial activities at the SLC parcel or the HAAF parcel. The lead agencies
32 presume that the BRAC and FUDS processes will result in implementation of
33 remedial approaches that provide cleanup of any contaminated sites to a
34 condition suitable for the proposed wetland use, and this is the basis for analysis

1 in this document In addition, it is presumed that the SLC and HAAF parcels will
2 be made suitable for wetland reuse by the BRAC and FUDS processes such that
3 no significant impact related to potential human or ecological exposure to
4 contaminants would be expected. If the remedial determinations ultimately made
5 through BRAC or FUDS require changes in the wetland designs proposed for the
6 HAAF or SLC parcels, then the lead agencies will evaluate the potential effects
7 of the changes and determine whether additional NEPA/CEQA compliance
8 would be necessary for that portion of the HWRP.

9 The Statement of Transfer for the Ammo Hill parcel, of which the City of
10 Novato-owned Bulge parcel is a part, did not identify any additional remedial
11 requirements for the area within the Bulge property, as the property is defined in
12 this document (U.S. Army Corps of Engineers 1999). The Statement of Transfer
13 also identified that all hazardous substances previously stored on the property
14 had been removed, and determined that all identified releases of hazardous
15 substances on the property had been assessed and appropriately remediated to
16 levels that do not pose a threat to human health or the environment (U.S. Army
17 Corps of Engineers 1999). Based on the conclusion in the Statement of Transfer,
18 no significant impacts related to hazardous substances are identified for the
19 proposed recreational use of a portion of the Bulge parcel.

20 According to the Phase I and Phase II assessments of the BMKV expansion site,
21 evidence of significant hazardous substances was not found on the BMKV
22 parcel. Shallow-soil sampling conducted in the Phase II site assessment revealed
23 the presence of metals, diesel fuel residue, DDT, dioxins, and furans within soils
24 in several areas on the BMKV parcel. Detections of DDT and most metals in
25 soils were at concentrations less than their corresponding EPA Region IX PRGs
26 for residential soil, with the exception of lead and arsenic in a sample from
27 beneath a debris pile. Dioxins and furans were detected in several soil samples
28 but at concentrations less than the Agency for Toxic Substances and Disease
29 Registry (ATSDR) screening levels for evaluation (Agency for Toxic Substances
30 and Disease Registry 1997).

31 Debris pile samples contained concentrations of lead, several other metals, and
32 DDT (and its breakdown products) greater than the cover and/or non-cover
33 RWQCB sediment screening criteria in table 4-11. One of the samples from the
34 aboveground tank area contained lead above the cover and non-cover screening
35 criteria in table 4-11; one of the samples from the east barn area contained
36 concentrations of DDT greater than the cover and non-cover RWQCB sediment
37 screening criteria; and one of the samples from the west barn area contained
38 concentrations of DDT greater than the RWQCB cover screening criteria.

39 Although the areas affected by potential soil contamination on the BMKV site
40 are limited, if left in place, there is the possibility of exposure of any associated
41 contamination in the restoration area. To reduce this impact to a less-than-
42 significant-level Mitigation Measure HAZ-1 would be implemented. The SLC
43 parcel, which is part of the authorized HWRP, is being remediated under the
44 FUDS program. The HAAF parcel, which is also part of the authorized HWRP,

1 is being remediated under the BRAC program. The lead agencies are required to
2 investigate and remediate identified toxic or hazardous substances to reduce the
3 risk of exposure to humans and prevent ecological degradation. Because of the
4 cleanup requirements discussed above, the existing remedial processes for the
5 SLC and the HAAF parcels, and the mitigation measures below for the BMKV
6 site, the potential to expose humans, plants, and wildlife to contaminants is
7 considered less than significant.

8 **Mitigation Measure HAZ-1: Coordinate with Department of Toxic**
9 **Substances Control on BMKV Site Clean-Up Requirements Prior to**
10 **Construction.**

11 The Conservancy shall coordinate with DTSC on defining DTSC's requirements
12 for BMKV site clean-up based on the results of the Phase I and II site
13 investigations. The requirements could include clean-up measures described in
14 the Phase I study, as appropriate, potentially including limited soil removal and
15 additional testing, as determined in consultation with DTSC, to address the
16 identified concerns on the BMKV site. These measures should be evaluated in
17 light of the proposed wetland reuse and implemented prior to construction, as
18 appropriate and in coordination with the DTSC. Any remedial activities will be
19 in compliance with applicable local, state, and federal regulations.

20 **Impact HAZ-2: Potential Exposure of Humans, Plants, or**
21 **Wildlife to Hazardous Chemicals Contained in Dredged**
22 **Material Used as Fill Material**

23 The process of dredging material from various sources and placing this material
24 to expedite creation of wetlands could disturb and redistribute contaminants that
25 have been buried or otherwise sequestered in the sediments. Once disturbed,
26 these contaminants may become biologically available in sediments and water
27 while being deposited at the site and may exert toxic effects on organisms that
28 come in contact with them. Sediment screening would be conducted in
29 accordance with the current requirements established by the DMMO, Corps,
30 RWQCB, and other LTMS agencies.

31 Because the proposed BMKV expansion would make use of only cover-quality
32 dredged material that satisfies the cover criteria, this impact is considered less
33 than significant in regards to sediment quality, and no mitigation is required (see
34 below concerning water quality).

35 As described in the *Water Quality* section in this chapter, although mercury often
36 resides in forms that are not hazardous, it can be transformed through natural
37 processes into toxic methylmercury. Although it is likely that mercury
38 methylation would increase as a result of the dredged placement approach, it is
39 not clear whether the act of placement causes more notable effects than the act of
40 dredging or whether either of those effects are more notable than the natural
41 methylation processes. Because no definitive conclusion can be made about this

1 impact, it is considered significant. To reduce this impact, mitigation measure
2 WQ-1, as proposed in the *Water Quality* section, would be implemented.

3 **Impact HAZ-3: Potential Exposure of Humans, Plants, or** 4 **Wildlife to Hazardous Chemicals due to Sedimentation** 5 **from Novato Creek and/or San Pablo Bay**

6 The final sediment layer in the three restoration alternatives would come from
7 sediment carried to the site by Novato Creek, nearby Petaluma River, and San
8 Pablo Bay. As described above, in some of the prior sampling efforts (although
9 apparently not in the most recent 2002 sampling), some of the sediments in
10 Novato Creek have concentrations of mercury that are greater than the existing
11 and proposed cover-sediment screening criteria. However, the sample results
12 reviewed for creek sediments near the site, for the most part did not indicate
13 concentrations of mercury greater than the existing or proposed noncover criteria.
14 Sampling to date has been limited, and conclusions about the quality of Novato
15 Creek sediments could change if more detailed and extensive site-specific studies
16 were conducted. It is also possible that some sediments near the site in San Pablo
17 Bay may have concentrations of mercury greater than the sediment screening
18 criteria for cover material.

19 Although only cover-quality dredged material would be used for wetland-
20 creation fill, natural sedimentation after breaching would result in migration of
21 sediment into the restoration area, with potential concentrations of mercury in
22 some sediments being greater than the cover-sediment screening criteria. While
23 sediments from Novato Creek and San Pablo Bay would nominally have ambient
24 concentrations of mercury, this would not eliminate the potential for mercury
25 methylation in the restored wetland area.

26 The primary concern about the deposition of sediments that contain elevated
27 concentrations of mercury in the wetland restoration area is that it may increase
28 the rate of mercury methylation, which could affect water quality. Due to the
29 biomagnification potential of methylmercury, increased methylation could affect
30 wildlife that may utilize the restoration site or nearby environments. However, it
31 is not currently possible to estimate the methylmercury concentrations or
32 bioaccumulation and biomagnification in the food chain that may occur. As
33 discussed in the *Water Quality* section, because a clear conclusion cannot be
34 made at this time regarding the potential for a significant adverse effect on the
35 environment, this impact is considered significant and unavoidable. Mitigation
36 WQ-1, a methylmercury adaptive management plan, is proposed to be developed
37 in concert with the appropriate regulatory agencies, including those responsible
38 for protection of biological resources such as DFG, USFWS, and NMFS. See the
39 *Water Quality* section for further discussion.

1 **Transportation**

2 This section analyzes the potential effects of the proposed BMKV expansion on
3 traffic and transportation.

4 **Affected Environment**

5 **Data Sources**

6 Information presented in this section is based on the following data sources.

- 7 ■ *Hamilton Wetland Restoration Plan Final EIR/EIS* (Jones & Stokes 1998)
- 8 ■ *Environmental Analysis of Tidal Marsh Restoration in San Francisco Bay*
9 (San Francisco International Airport 2001)

10 **Roadway Network**

11 **Regional Access**

12 Regional access to the expansion site is provided by U.S. Highway 101 and State
13 Route 37. U.S. Highway 101 is a principal north–south freeway that connects the
14 expansion site to Sonoma County to the north and the San Francisco Bay Area to
15 the south. State Route 37 extends east from U.S. Highway 101 in Novato to
16 Interstate 80 in Vallejo.

17 **Access to BMKV Expansion Area**

18 Current access to the BMKV site is provided by Ignacio Boulevard and Bel
19 Marin Keys Boulevard. Ignacio Boulevard provides access to the site from U.S.
20 Highway 101, turning into Bel Marin Keys Boulevard as the site is approached
21 from the west. No public roadways exist within the BMKV parcel. The existing
22 private roads on the site are used primarily for agricultural operations.

23 In the 1998 EIS/EIR for the original HWRP, the identified construction access to
24 the HWRP is from Nave Drive to New Hamilton Parkway to Todd Road to the
25 HAAF parcel. As described in Chapter 3, this would be the primary access route
26 to the BMKV expansion site and Bel Marin Keys Boulevard would be the
27 secondary access route.

28 The SLC site may be accessed by a legally deeded access easement across the
29 HAAF site. Although no official map of the easement exists, it is described as a

1 40-foot easement that extends from the entrance of the HAAF site to the SLC
2 property. The easement is located adjacent to the Bay, and crosses over existing
3 roads, including Main Gate Road, Palm Drive, Hangar Avenue, and Perimeter
4 Road.

5 **Existing Levels of Service**

6 Traffic and transportation movement is measured by a level of service (LOS)
7 rating, which ranges from A to F. LOS A is operationally the most efficient and
8 generally exhibits the least amount of traffic delays and resulting congestion.
9 Each successive LOS (B through F) is less operationally efficient. Standard
10 descriptions of LOS service are provided in tables 4-14 (following this page) and
11 4-15. The existing LOS for the 2 critical intersections that provide access to the
12 expansion area from Highway 101 are estimated to range from B to D during
13 a.m. and p.m. peak hours (see table 4-16). The LOS for existing peak-hour
14 freeway operations is estimated to range from D to E/F on U.S. Highway 101 and
15 is estimated at B on State Route 37, within the vicinity of the expansion area.

16 **Table 4-15.** Unsignalized Intersection LOS Criteria

Level of Service	Description	Average Control per Vehicle (Seconds)
A	Little or no delays.	≤ 10.0
B	Short traffic delays.	> 10.0 to 15.0
C	Average traffic delays.	> 15.0 to 25.0
D	Long traffic delays.	> 25.0 to 35.0
E	Very long traffic delays	> 35.0 to 50.0
F	Extreme traffic delays with intersection capacity exceeded.	> 50.0

Source: Transportation Research Board Highway Capacity Manual, 2000.

17
18 **Table 4-16.** Intersection Level of Service and Peak-Hour Freeway Operations

Intersection	LOS	
	A.M.	P.M.
Ignacio Boulevard/U.S. Highway 101 southbound ramps	D	C
Ignacio Boulevard/U.S. Highway 101 northbound ramps	B	D

Source: Hamilton Wetland Restoration Plan EIR/EIS, 1998.

Table 4-14. Signalized Intersection LOS Criteria

LOS	Sum of Critical Volume to Capacity Ratio	Description
A	< 0.60	Operations with very low control delay, up to 10 seconds per vehicle. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
B	0.61 – 0.70	Operations with control delay great than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of average delay.
C	0.71 – 0.80	Operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, though many still pass through the intersection without stopping.
D	0.81 – 0.90	Operations with control delay greater than 35 seconds and up to 55 seconds per vehicle. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	0.91 – 1.00	Operations with control delay greater than 55 and up to 80 seconds per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. The individual cycle failures are frequent occurrences.
F	> 1.00	Operation with control delay in excess of 80 seconds per vehicle. This level, considered to be unacceptable with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high v/c ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to such delay levels.

Source: Contra Costa Transportation Authority, Technical Procedures, 1997.

1 **Environmental Consequences and Mitigation** 2 **Measures**

3 This section analyzes impacts on transportation associated with construction and
4 operation of each restoration alternative. Impacts associated with transporting
5 materials from the dredge site to the hydraulic off-loaders have been evaluated as
6 part of other environmental documentation for the Oakland Harbor navigation
7 improvement project (U.S. Army Corps of Engineers and Port of Oakland 1998a,
8 1998b, 1998c, and 1998d). The document concluded that transporting dredged
9 material by barge would not result in a significant impact on transportation.

10 **Approach and Methods**

11 Implementation of the proposed BMKV expansion could result in impacts
12 associated with construction, operation, and maintenance of the expansion site.
13 Construction-related impacts could result from trips made by construction
14 workers to and from the expansion site. Operation and maintenance impacts may
15 occur as a result of trips made to the site by caretakers, researchers, or visitors.

16 Assigning LOS is a quantitative method for describing traffic conditions on
17 intersections and road segments. LOS ranges from A (uncongested) to F (totally
18 congested). Under the No-Action Alternative, it is assumed that existing land
19 uses would remain the same, and therefore there would be no increase in existing
20 traffic conditions at major intersections providing access to the site, as shown in
21 table 4-16.

22 The total number of daily trips generated during the construction phase of the
23 proposed BMKV expansion was based on the equipment estimates for the
24 construction phase of the proposed BMKV expansion. The largest number of
25 construction vehicles would be used during the enhancement and construction of
26 perimeter and internal levees. Based on the number of pieces of construction
27 equipment needed, construction of the proposed BMKV expansion was estimated
28 to result in an increase of up to approximately 72 daily vehicle trips to the
29 expansion site, including 17 trips during each morning and evening commute
30 period, and 10 during the lunch hour. The methods and assumptions used to
31 arrive at this estimate are described in appendix E.

32 Visitation by the public would be allowed after construction is completed. Public
33 use would be restricted to the interpretive center and the Bay Trail routes that are
34 proposed around the perimeter and within the expansion site. Trips associated
35 with public use and operation and maintenance of the proposed BMKV
36 expansion are expected to be minimal and are not expected to affect circulation
37 patterns or capacity at nearby intersections or roadway alignments. Parking
38 would be provided at the interpretive center/access area/trailhead.

1 **Impact Mechanisms**

2 Construction of the proposed BMKV expansion is the impact mechanism that
3 would affect transportation, particularly construction related to perimeter and
4 internal levee enhancement and creation.

5 **Thresholds of Significance**

6 The following significance criteria were used to evaluate the proposed BMKV
7 expansion. Regarding transportation, the proposed expansion was identified as
8 resulting in a significant impact on the environment if it would

- 9 ■ cause the LOS at local intersections to increase to unacceptable levels
10 (typically, from LOS D or better to LOS E or F);
- 11 ■ substantially increase traffic volumes such that traffic increases along
12 freeways or ramps that previously had an acceptable LOS;
- 13 ■ contribute substantially to traffic congestion at local intersections, ramps, or
14 freeways that already operate at an unacceptable LOS; or
- 15 ■ interfere with existing transportation systems, causing substantial alteration
16 by exceeding existing or proposed transit capacity, or cause transit delays, by
17 resulting in an unacceptable LOS.

18 **Impacts and Mitigation Measures of the No-Action** 19 **Alternative**

20 Under the No-Action alternative, no restoration activities would occur, and no
21 impact on LOS at major intersections and roadway segments adjacent to the
22 expansion area would occur.

23 **Impacts and Mitigation Measures Common to** 24 **Alternatives 1–3**

25 **Impact T-1: Change in LOS at Important Intersections and** 26 **Roadway Segments during the Construction Phase**

27 Restoration activities would increase the number of vehicle trips to the expansion
28 site by an estimated 17 daily construction-worker vehicles per day under
29 Alternatives 1–3 during the site preparation phase. Including construction
30 vehicle activity from the site, this could result in up to approximately 72 vehicle
31 trips to and from the site on a daily basis for several years. Dredged material
32 would then be placed on the expansion site under Phase 2 of site construction,

1 “Dredged Material Placement.” Phase 2 would last approximately 10 years
2 under Alternative 1 and Revised Alternative 2, and 3 years under Alternative 3.
3 During Phase 2, the number of construction vehicles travelling to and from the
4 site would largely decrease because construction activities would focus on off-
5 loading dredged material to the site. Therefore, the placement of dredged
6 material requires far less construction equipment travelling to and from the site
7 on a daily basis. Following the placement of dredged material on the site,
8 Phase 3, “Earthwork and Tidal Connection,” would last approximately 1 year for
9 each alternative and would increase the number of construction vehicles
10 travelling to and from the site from Phase 2. The number of vehicles expected
11 during Phase 3 would not exceed the number of estimated vehicles under Phase 1
12 of site construction.

13 Based on the existing LOS for intersections and roadway segments shown in
14 table 4-16, the expected daily increase in construction traffic would not change
15 the LOS on freeway alignments or important intersections that support the
16 expansion site. Because the minimal increase in daily traffic is not expected to
17 result in a change in LOS, the impact on transportation under Alternatives 1–3 is
18 considered less than significant. No mitigation is required.

19 **Impact T-2: Change in LOS at Important Intersections and** 20 **Roadway Segments during the Operation Phase**

21 During the operation phase of the proposed BMKV expansion under
22 Alternatives 1–3, a minimal number of trips to the expansion site would be
23 required for maintenance and monitoring activities and for access to the Bay
24 Trail and interpretive center. The number of daily trips expected under the
25 operation phase of the proposed BMKV expansion would be greatly reduced
26 from the construction phase of the proposed BMKV expansion. The number of
27 additional trips attributable to maintenance and monitoring and recreational users
28 would be small compared to the existing volume of traffic at intersections and
29 roadway segments that support the expansion site. A small amount of parking
30 (10 to 20 spaces) would be provided at the interpretive center location. Impacts
31 on traffic circulation attributable to operation of the proposed BMKV expansion
32 are considered less than significant because the LOS at roadway segments and
33 intersections is not expected to change. No mitigation is required.

Air Quality

Affected Environment

Data Sources

The existing air quality conditions for the proposed expansion area were defined using information provided in the *Hamilton Wetland Restoration Plan Final EIR/EIS* (Jones & Stokes 1998). In addition, the Bay Area Air Quality Management District's (BAAQMD's) guidelines for assessing air quality impacts were used to evaluate the environmental effects associated with the proposed restoration alternatives (Bay Area Air Quality Management District 1999).

Climate

The concentration of a given pollutant in the atmosphere is determined by the amount of pollutant released and the atmosphere's ability to transport and dilute the pollutant. The major determinants of air pollution transport and dilution are wind, atmospheric stability, terrain, and insolation.

The topography of Novato is generally flat, and elevation is less than 100 feet above sea level. The expansion area is characterized by warm, dry summers and cool, moist winters.

Figure 4-15 shows the wind rose for a meteorological station located at HAAF, which is adjacent to the expansion area. The wind rose shows the percentage of time wind blows in each direction and the mean wind speed by direction. Annually, the predominant wind direction is from the northwest. During spring and fall, the predominant direction is from the west-northwest. The predominant wind direction is from the east-southeast during summer and from the north-northwest during winter. Mean wind speeds range from 5 to 10 miles per hour, and calm winds occur 31.3% of the time (California Air Resources Board 1984).

Federal and State Ambient Air Quality Standards

The State of California and the federal government have each established ambient air quality standards for air pollutants (see table 4-17). For some pollutants, separate standards have been set for different periods, with most standards set to protect public health; however, for some pollutants, standards have been based on other values, such as protection of crops, protection of materials, or avoidance of nuisance conditions.

Table 4-17. Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	State Standard	Federal Standard
Ozone	8 hours	—	0.08 ppm
	1 hour	0.09 ppm (180 $\mu\text{g}/\text{m}^3$)	0.12 ppm (235 $\mu\text{g}/\text{m}^3$)
Carbon Monoxide	8 hours	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)
	1 hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)
Nitrogen Dioxide	annual average	—	0.053 ppm (100 $\mu\text{g}/\text{m}^3$)
	1 hour	0.25 ppm (470 $\mu\text{g}/\text{m}^3$)	—
Sulfur Dioxide	annual average	—	80 $\mu\text{g}/\text{m}^3$ (0.03 ppm)
	24 hours	0.04 ppm (105 $\mu\text{g}/\text{m}^3$)	365 $\mu\text{g}/\text{m}^3$ (0.14 ppm)
	1 hour	0.25 ppm (655 $\mu\text{g}/\text{m}^3$)	—
Particulate Matter (PM10)	annual arithmetic mean	—	50 $\mu\text{g}/\text{m}^3$
	annual geometric mean	30 $\mu\text{g}/\text{m}^3$	—
	24 hours	50 $\mu\text{g}/\text{m}^3$	150 $\mu\text{g}/\text{m}^3$
Particulate Matter—Fine (PM2.5)	annual arithmetic mean	—	15 $\mu\text{g}/\text{m}^3$
	24 hours	—	65 $\mu\text{g}/\text{m}^3$
Sulfates	24 hours	25 $\mu\text{g}/\text{m}^3$	—
Lead	calendar quarter	—	1.5 $\mu\text{g}/\text{m}^3$
	30-day average	1.5 $\mu\text{g}/\text{m}^3$	—
Hydrogen Sulfide	1 hour	0.03 ppm (42 $\mu\text{g}/\text{m}^3$)	—
Vinyl Chloride (chloroethene)	24 hours	0.010 ppm (26 $\mu\text{g}/\text{m}^3$)	—
Visibility-Reducing Particles	8 hours (1000–1800 PST)	*	—

Notes: ppm = parts per million
 mg/m^3 = milligrams per cubic meter
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

* Statewide VRP Standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70%. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

1 The air pollutants of greatest concern in the expansion area include carbon
2 monoxide (CO), ozone, and inhalable particulate matter less than 10 microns in
3 diameter (PM10).

4 **State and Federal Attainment Status**

5 The San Francisco Bay Area Air Basin (SFBAAB) includes the City of San
6 Francisco; portions of Sonoma and Solano Counties; and all of San Mateo, Santa
7 Clara, Alameda, Contra Costa, Marin, and Napa Counties.

8 The SFBAAB is currently classified as a nonattainment area for the state PM10
9 standards and for the state and federal ozone standards. The SFBAAB is an
10 attainment area for the federal PM10 standards and for the state and federal NO2
11 and SO2 standards. The SFBAAB is also an attainment area for the state CO
12 standards and a maintenance area for the federal CO standards.

13 **State and Federal Air Quality Management Programs**

14 Air pollution control programs were established in California before the
15 enactment of federal requirements. Federal Clean Air Act legislation in the
16 1970s resulted in a gradual merging of state and federal air quality programs,
17 particularly those relating to industrial sources. Air quality management
18 programs developed in California since the late 1980s have generally responded
19 to requirements established by the federal Clean Air Act.

20 The enactment of the California Clean Air Act in 1988 and the federal Clean Air
21 Act Amendments of 1990 has produced additional changes in the structure and
22 administration of air quality management programs. The California Clean Air
23 Act requires preparation of an air quality attainment plan for any area that
24 violates state air quality standards for CO, sulfur dioxide (SO2), nitrogen dioxide
25 (NO2), or ozone. Locally prepared attainment plans are not required for areas
26 that violate the state standards for PM10. The California Air Resources Board
27 (CARB) is addressing PM10 attainment issues.

28 Air pollution problems in the SFBAAB are primarily the result of locally
29 generated emissions. The SFBAAB, however, has been identified as a source of
30 ozone precursor emissions, which occasionally contribute to air quality problems
31 in the Monterey Bay area, the northern San Joaquin Valley, and the southern
32 Sacramento Valley. Consequently, in addition to correcting local air pollution
33 problems, air quality planning efforts for the SFBAAB must also reduce the
34 area's impact on downwind air basins.

35 The BAAQMD has prepared 2 recent air quality plans designed to bring the
36 SFBAAB into attainment with ozone standards. The 1999 Ozone Attainment
37 Plan was designed to bring the SFBAAB into attainment with the federal ozone
38 ambient air quality standards. It was approved by the CARB but was partially

1 disapproved by the U.S. EPA (Bay Area Air Quality Management District,
2 Metropolitan Transportation Commission, and Association of Bay Area
3 Governments 1999; www.BAAQMD.gov). This plan contained 11 control
4 strategy measures that would have included development and implementation of
5 additional air quality rules and regulations for emission sources within the
6 SFBAAB. A Bay Area 2001 Ozone Attainment Plan is currently being prepared
7 by the BAAQMD, the Metropolitan Transportation Commission, and the
8 Association of Bay Area Governments. This plan is a proposed revision to the
9 Bay Area portion of California's plan to achieve the national ozone standard.
10 The plan is being prepared in response to EPA's partial approval and partial
11 disapproval of the Bay Area's 1999 Ozone Attainment Plan.

12 On December 20, 2000, the BAAQMD adopted the 2000 Clean Air Plan (CAP)
13 (Bay Area Air Quality Management District 2000). The CAP represents the third
14 triennial update of the 1991 CAP. It contains additional rules and regulations
15 that are designed to bring the SFBAAB into attainment with the California ozone
16 ambient air quality standards.

17 **Federal Clean Air Act Conformity**

18 As required by the 1990 Federal Clean Air Act Amendments, EPA enacted 2
19 separate federal conformity rules. Those rules (incorporated as Section 40 CFR
20 Parts 51 and 93) are designed to ensure that federal actions do not cause or
21 contribute to air quality violations in areas that do not meet the national ambient
22 air quality standards. The 2 rules include transportation conformity, which
23 applies to transportation plans, programs, and projects, and general conformity,
24 which applies to all other nontransportation-related projects.

25 The general, conformity regulation requires that federal agencies sponsoring
26 nontransportation-related activities show that the emissions associated with those
27 activities conform to state implementation plans (SIPs) if emissions meet specific
28 criteria. First, the emissions must occur in areas designated as nonattainment
29 areas for one or more of the federal ambient air quality standards. Second, those
30 emissions must exceed certain *de minimis* threshold levels.

31 The proposed wetland restoration is subject to a federal conformity analysis
32 under the general conformity rule. Currently, the SFBAAB, which includes
33 Marin County, where the proposed wetland restoration is located, is classified as
34 a moderate federal nonattainment area for ozone. Ozone is an indirectly
35 generated pollutant that results when the ozone precursors NO_x and reactive
36 organic gases (ROG) form in the atmosphere in the presence of sunlight.
37 Because ozone is not a directly emitted pollutant, EPA has, in its general
38 conformity regulations, set *de minimis* levels for ozone precursors rather than for
39 ozone. From a conformity standpoint, areas classified as moderate ozone
40 nonattainment areas are exempt from conformity if emissions of ROG are less
41 than 50 tons per year and emissions of NO_x are less than 100 tons per year.

Existing Air Quality Conditions

The existing air quality conditions in the proposed expansion area are characterized by air quality monitoring data collected in the region. PM10, CO, and ozone concentrations are measured at several north Bay monitoring stations. Recent monitoring data are presented in table 4-18. The closest monitoring station is located in San Rafael. A description of the major pollutants found in the expansion area is provided below.

Ozone

Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Ozone is a severe eye, nose, and throat irritant. Ozone also attacks synthetic rubber, textiles, plants, and other materials. Ozone causes extensive damage to plants by leaf discoloration and cell damage.

State and federal standards for ozone have been set for a 1-hour averaging time. The state 1-hour ozone standard is 0.09 ppm, not to be exceeded more than 3 days in 3 years. The federal 1-hour ozone standard is 0.12 ppm, not to be exceeded more than 3 times in any 3-year period. The monitoring data has shown few instances where exceedances of the ozone state standard occurred during the 3 most recent years of available data.

Ozone is not emitted directly into the air, but is formed by a photochemical reaction in the atmosphere. Ozone precursors, which include ROG and oxides of nitrogen (NOx), react in the atmosphere in the presence of sunlight to form ozone. Because photochemical reaction rates depend on the intensity of ultraviolet light and air temperature, ozone is primarily a summer air pollution problem. The ozone precursors, ROG and NOx, are emitted by mobile sources and by stationary combustion equipment.

Carbon Monoxide

Carbon monoxide is essentially inert to plants and materials but can have significant effects on human health. Carbon monoxide is a public health concern because it combines readily with hemoglobin and thus reduces the amount of oxygen transported in the bloodstream. Effects on humans range from slight headaches and nausea to death.

State and federal CO standards have been set for both 1-hour and 8-hour averaging times. The state 1-hour standard is 20 parts per million (ppm) by volume, and the federal 1-hour standard is 35 ppm. Both state and federal standards are 9 ppm for the 8-hour averaging period. The monitoring data shows no recorded violations of the CO standards during the 3 most recent years of available data.

Table 4-18. Ambient Air Quality Monitoring Data Recorded at San Rafael Monitoring Station

Pollutant Standards	1998	1999	2000
Ozone (O₃)			
Maximum 1-hour concentration (ppm)	0.074	0.102	0.071
No. Days Standard Exceeded			
NAAQS (1-hour) > 0.12 ppm	0	0	0
CAAQS (1-hour) > 0.09 ppm	0	2	0
Carbon Monoxide (CO)			
Maximum 8-hour concentration (ppm)	3.3	2.9	2.3
Maximum 1-hour concentration (ppm)	5.9	5.6	4.2
No. Days Standard Exceeded			
NAAQS (8-hour) ≥ 9.0 ppm	0	0	0
NAAQS (1-hour) ≥ 35 ppm	0	0	0
CAAQS (8-hour) ≥ 9.0 ppm	0	0	0
CAAQS (1-hour) ≥ 20 ppm	0	0	0
Particulate Matter (PM₁₀)			
Maximum 24-hour concentration (µg/m ³)	52.4	75.6	39.5
2 nd highest 24-hour concentration (µg/m ³)	39.8	64.4	38.7
Average arithmetic mean concentration (µg/m ³)	20.1	22.0	19.5
Average geometric mean concentration (µg/m ³)	18.7	19.5	18.1
No. Days Standard Exceeded			
NAAQS (24-hour) > 50 µg/m ³	0	0	0
CAAQS (24-hour) > 150 µg/m ³ ¹	1	2	0

¹Recorded every six days.

Source: California Air Resources Board 2002; Environmental Protection Agency 2002

1 Motor vehicles are the dominant source of CO emissions in most areas. High CO
2 levels develop primarily during winter when periods of light wind combine with
3 the formation of ground-level temperature inversions (typically from the evening
4 through early morning). These conditions result in reduced dispersion of vehicle
5 emissions. Motor vehicles also exhibit increased CO emission rates at low air
6 temperatures.

7 **Particulates**

8 Health concerns associated with suspended particulate matter focus on those
9 particles small enough to reach the lungs when inhaled. Particulates can damage
10 human health and retard plant growth. Particulates also reduce visibility, soil
11 buildings and other materials, and corrode materials. The primary particulate of
12 concern in the expansion area is PM10.

13 The state PM10 standards are 50 micrograms per cubic meter as a 24-hour
14 average and 30 micrograms per cubic meter as an annual geometric mean. The
15 federal PM10 standards are 150 micrograms per cubic meter as a 24-hour
16 average and 50 micrograms per cubic meter as an annual arithmetic mean. The
17 monitoring data shows a few exceedances of the state PM10 24-hour standard
18 during the 3 most recent years of available data.

19 PM10 emissions are generated by a wide variety of sources, including
20 agricultural activities, industrial emissions, dust suspended by vehicle traffic, and
21 secondary aerosols formed by reactions in the atmosphere.

22 **Environmental Consequences and Mitigation** 23 **Measures**

24 **Approach and Methods**

25 The approach used in evaluation of air quality impacts is generally qualitative
26 and follows requirements outlined by the BAAQMD. The BAAQMD's
27 approach to analysis of construction impacts is to emphasize implementation of
28 effective and comprehensive control measures rather than detailed quantification
29 of emissions (Bay Area Air Quality Management District 1999). However,
30 because of the requirement to prepare a general conformity analysis as required
31 by EPA and BAAQMD, a quantitative evaluation of ozone precursors was
32 conducted.

Impact Mechanisms

Impacts analyzed in this document include onsite construction emissions and emissions due to visitor or maintenance activity after the restoration activity is completed. Emissions associated with transport of dredged material to the site are not included as they are presumed to be analyzed in the environmental compliance documentation associated with dredging projects that may propose to use BMKV as a dredged material placement location.

Construction of the proposed wetland restoration may generate significant air emissions. Terrestrial construction-related emissions are generally short term but may still cause adverse air quality impacts. Fine particulate matter (PM10) is the pollutant of greatest concern with respect to terrestrial construction activities. PM10 emissions can result from a variety of construction activities, including excavation, grading, demolition, vehicle travel on paved and unpaved roads, and emission of vehicle and equipment exhaust. Terrestrial construction-related emissions of PM10 can vary greatly depending on the level of activity, the specific operations taking place, the equipment being operated, local soils, weather conditions and other factors. Construction-related emissions can cause substantial increases in localized concentrations of PM10. Particulate emissions from construction activities can lead to adverse health effects, as well as nuisance concerns such as reduced visibility and soiling of exposed surfaces (Bay Area Air Quality Management District 1999).

In addition, PM10 emissions could be generated from the dredged material as it dries, prior to breaching of the levees.

Terrestrial construction equipment emits CO and ozone precursors. However, these emissions are included in the emission inventory that is the basis for the regional air quality plans. Terrestrial construction equipment activities are not expected to impede attainment or maintenance of ozone and CO standards in the Bay Area (Bay Area Air Quality Management District 1999). Impacts on CO are assumed to be less than significant and are not evaluated further. Ozone precursors are evaluated in the general conformity analysis.

Use of diesel pumps and associated equipment to off-load and pump dredged material from offshore into the expansion site could also result in the emission of ozone precursors.

At full function, the proposed BMKV expansion would generate air emissions related to visitor use and maintenance activities. Because visitor use and periodic maintenance activities would be limited, impacts on air emissions from visitor use and maintenance activities are considered less than significant.

1 **Thresholds of Significance**

2 The following significance criteria were used to evaluate the proposed BMKV
3 expansion. Regarding air quality, the proposed expansion was identified as
4 resulting in a significant impact on the environment if it would

- 5 ■ allow uncontrolled emissions of PM10; or
- 6 ■ result in annual emissions exceeding EPA and BAAQMD conformity
7 thresholds (50 tons ROG per year or 100 tons NOx per year).

8 **Impacts and Mitigation Measures of No-Action** 9 **Alternative**

10 Under the No-Action Alternative, the expansion area would not be used as a
11 wetland restoration site and existing uses are expected to continue. Because no
12 changes in activities are expected under the No-Action Alternative, no change in
13 PM10, CO, or ozone precursors would occur.

14 **Impacts and Mitigation Measures Common to** 15 **Alternatives 1–3**

16 **Impact A-1: Construction-Related Emissions of PM10** 17 **from Terrestrial Construction Equipment**

18 As described above under *Impact Mechanisms*, implementation of the proposed
19 BMKV expansion would result in PM10 emissions, resulting from grading and
20 other ground-disturbing activities required for site preparation, dredged material
21 placement, and other restoration activities. This impact would be considered
22 significant. To reduce this impact to a less-than-significant level, the following
23 mitigation measure would be implemented:

24 **Mitigation Measure A-1: Control PM10 Emissions in Accordance** 25 **with BAAQMD Standards.**

26 **Basic Control Measures** – The following controls should be implemented at all
27 construction sites.

- 28 ■ Water all active construction areas at least twice daily.
- 29 ■ Cover all trucks hauling soil, sand, and other loose materials or require all
30 trucks to maintain at least 2 feet of freeboard.
- 31 ■ Pave, apply water 3 times daily, or apply (nontoxic) soil stabilizers on all
32 unpaved access roads, parking areas, and staging areas at construction sites.

- 1 ■ Sweep daily (with water sweepers) all paved access roads, parking areas and
2 staging areas at construction sites.
- 3 ■ Sweep streets daily (with water sweepers) if visible soil material is carried
4 onto adjacent public streets.

5 **Enhanced Control Measures** – The following measures should be implemented
6 at construction sites greater than 4 acres in area.

- 7 ■ Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas
8 (previously graded areas inactive for 10 days or more).
- 9 ■ Enclose, cover, water twice daily, or apply (non-toxic) soil binders to
10 exposed stockpiles (dirt, sand, etc.).
- 11 ■ Limit traffic speeds on unpaved roads to 15 mph.
- 12 ■ Install sandbags or other erosion control measures to prevent silt runoff to
13 public roadways.
- 14 ■ Replant vegetation in disturbed areas as quickly as possible.

15 **Optional Control Measures** – The following control measures will be
16 considered for use at construction sites that are large in area, located near
17 sensitive receptors, or which may warrant additional emissions reductions for any
18 other reason.

- 19 ■ Install wheel washers for all exiting trucks, or wash off the tires or tracks of
20 all trucks and equipment leaving the site.
- 21 ■ Install wind breaks, or plant trees/vegetative wind breaks at windward side(s)
22 of construction areas.
- 23 ■ Suspend excavation and grading activity when winds (instantaneous gusts)
24 exceed 25 mph.
- 25 ■ Limit the area subject to excavation, grading, and other construction activity
26 at any one time.

27 **Impact A-2: Construction-Related Emissions of Ozone** 28 **Precursors from Terrestrial Equipment and Equipment** 29 **Associated with Offloading of Dredged Material**

30 An emissions estimate for construction activity was developed to analyze the
31 general conformity of the proposed BMKV expansion. This conformity analysis
32 is presented in appendix E. The estimate for terrestrial construction activity
33 (other than activity associated with off-loading of dredged material) identifies
34 that the alternatives could generate emissions of up to 1.7 tons per year of ROG
35 and 25.2 tons per year of NOx during the onshore construction activity.

36 Emission estimates were also developed for equipment associated with off-
37 loading of dredged material. Dredged material would arrive by barge at the

1 offshore off-loading facility. Off-loading of dredged material would involve the
2 use of supporting marine vessels and other equipment, as well as hydraulic
3 pumping of the dredged material to the HWRP sites, including the BMKV site.
4 Several options for pumping are being considered, including use of electrically
5 driven pumps, use of diesel-fired pumps, and combinations of the two.
6 Electrically driven pumps would not generate any site-related emissions by
7 themselves. Diesel pumps, marine vessel engines, and associated equipment
8 (like generators) would generate NO_x in addition to other priority pollutants. For
9 this analysis, only emissions for NO_x were estimated as an indicator of pumping
10 equipment that may pose a regulatory concern. The emissions estimate includes
11 off-loader pumps, generators, a work tug at the off-loader facility, a crew boat, a
12 loader, and several hydracranes and bulldozers that would assist with the
13 pumping activity.

14 Three different scenarios reflecting different levels of annual dredged material
15 (low—0.5 million cubic yards [mcy], medium—1.25 mcy, and high—3.5 mcy)
16 were evaluated to reflect a range of possible dredged material delivery volumes
17 to the BMKV site. The emissions estimate is summarized in table 4-19 and
18 presented in appendix E. The following 5 configurations were evaluated.

- 19 ■ Diesel Unmitigated – The unmitigated case assumed all equipment to be
20 diesel-powered with engines typical of existing equipment.
- 21 ■ Diesel Mitigated – The mitigated case assumed that emission reduction
22 technology would be implemented on the main engines of the off-loader and
23 booster pump only. Emission reduction was based on the use of selective
24 catalytic reduction (SCR) to the engines.
- 25 ■ Electrified – This case assumed that the off-loader and booster pumps are
26 electric.
- 27 ■ Electrified Booster/Diesel Off-loader – This case was a hybrid of the
28 unmitigated case and the electrified case.
- 29 ■ Electrified Booster/Diesel Off-loader (mitigated) – This case was a hybrid of
30 the mitigated case and the electrified case.

31 In the diesel unmitigated case, the emissions estimate in the medium and high
32 scenarios would be above the conformity threshold of 100 tons. In the diesel
33 mitigated case, only the emissions associated with the high scenario would
34 exceed the threshold. NO_x emissions in the electrified case were below the
35 threshold for all three scenarios. Emissions in the hybrid unmitigated case were
36 above the threshold only for the high scenario. NO_x emissions in the hybrid
37 mitigated case were below the threshold for all 3 scenarios.

38 Depending on the choice of equipment and power source (diesel or electric) and
39 upon the amount of dredged material pumped per year, NO_x emissions could
40 exceed the conformity threshold and result in a significant impact on air quality.
41 To reduce this impact to a less-than-significant level, Mitigation Measure A-2
42 would be implemented

1 **Mitigation Measure A-2: Control and/or Offset NOx Emissions**
2 **Associated with Off-loading Dredged Material.**

3 One or more of the following options will be implemented in order to mitigate
4 NOx emissions to a less-than-significant level.

- 5 ■ **Option 1** – Use electric power for the off-loader and booster pumps.
- 6 ■ **Option 2** – Use SCR for the diesel off-loader and booster-pump engines, and
7 limit annual pumping activity to a level that will result in emissions below
8 the conformity thresholds.
- 9 ■ **Option 3** – Use electric power for the booster-pump engines and SCR for the
10 diesel off-loader pump engine
- 11 ■ **Option 4** – Use electric power for the booster-pump engines, and limit
12 annual pumping activity to a level that will result in emissions below the
13 conformity thresholds.
- 14 ■ **Option 5** – Use diesel pumps, and limit annual pumping activity to a level
15 that will result in emissions below the conformity thresholds. Based on the
16 emissions estimate prepared, this annual volume limit would be
17 approximately 1 mcy/year.
- 18 ■ **Option 6** – Pursue an engine retrofit program for locally operated tugboats in
19 order to compensate for potential exceedance(s) of the conformity levels.
- 20 ■ **Option 7** – Purchase offsetting mitigation credits from other regulated
21 entities.

22 With implementation of this mitigation, this impact to air quality is considered
23 less than significant.

24 **Impacts Unique to Alternative 3**

25 **Impact A-3: Operational Emissions of a Relief Pump**

26 Operation of relief pump(s) at the pump station for relief of high water (above
27 1.5' NGVD) in the BMK south lagoon could result in emissions of priority
28 pollutants. The specific design of the pump(s) has not been conducted, thus it is
29 unknown if they would be electric or diesel and what their emission
30 characteristics would be. However, assuming they are diesel (or that at least a
31 backup pump is diesel), operation could result in release of emissions of priority
32 pollutants. This pump would only operate sporadically when necessary to
33 provide relief of high-water levels in the south lagoon. Since the need for
34 operation is limited to periodic storm events, it is unlikely that the pump would
35 be operated a sufficient number of hours to exceed the annual emissions
36 thresholds listed in the significance criteria, and thus this impact is considered to
37 be less than significant. If this alternative were selected, the project sponsors
38 would consult with BAAQMD to determine if the relief pump required a permit
39 and what best management practices for the pump would be appropriate.

Table 4-19. Off-loading Activity NOx Emissions Summary, BMKV Expansion (annual tons)

Scenario (Annual mcy)	Low (0.5 mcy)	Medium (1.25 mcy)	High (3.5 mcy)
Diesel Unmitigated	68.9	138.4	346.8
Diesel Mitigated	40.4	66.7	145.6
Electrified	6.8	17.0	47.8
Diesel Off-loader (unmitigated)/ Elec. Booster	35.6	70.1	173.3
Diesel Off-loader (mitigated)/ Elec. Booster	23.9	40.7	91.2

BAAQMD Conformity Threshold for NOx = 100 tons/year

1 Noise

2 Affected Environment

3 This section evaluates noise impacts associated with the proposed BMKV
4 expansion. Construction noise would be the only notable source of noise
5 associated with restoration. Use or maintenance of the restoration site would not
6 generate significant noise.

7 Data Sources and Terminology

8 *The Hamilton Wetland Restoration Plan Final EIR/EIS* (Jones & Stokes 1998)
9 provided the basis for this discussion.

10 The following are brief definitions of acoustical terminology used in the analysis
11 of noise impacts.

12 **Sound** – A vibratory disturbance created by a vibrating object which, when
13 transmitted by pressure waves through a medium such as air, is capable of being
14 detected by a receiving mechanism such as the human ear or a microphone.

15 **Noise** – Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

16 **Ambient Noise** – The composite of noise from all sources near and far in a given
17 environment exclusive of particular noise sources to be measured.

18 **Decibel, dB** – A unitless measure of sound on a logarithmic scale which
19 indicates the squared ratio of sound pressure amplitude to a reference sound
20 pressure amplitude. The reference pressure is 20 micro-Pascals.

21 **A-Weighted Decibel, dBA** – An overall frequency-weighted sound level in
22 decibels which approximates the frequency response of the human ear.

23 **Equivalent Sound Level, Leq** – The equivalent steady state sound or vibration
24 level which in a stated period of time would contain the same acoustical or
25 vibration energy.

26 **Percentile Exceeded Sound Level, Lxx** – The sound level exceeded a specified
27 percentage of the measurement duration. For L₁₀ is the sound level exceeded 10
28 percent of the time and L₉₀ is the sound level exceeded 90 percent of the time.

29 **Day-Night Level, Ldn** – The energy average of the A-weighted sound levels
30 occurring during a 24-hour period, with 10 dB added to the A-weighted sound
31 levels occurring during the period from 10 p.m. to 7 a.m.

1 In general, human sound perception is such that a change in sound level of 3 dB
2 is generally perceived as being just noticeable, a change of 5 dB is clearly
3 noticeable, and a change of 10 dB is perceived as a doubling or halving of sound
4 level.

5 **Noise-Sensitive Land Uses in the Expansion Area**

6 Noise-sensitive land uses are generally defined as locations where people reside
7 or where the presence of unwanted sound could adversely effect the use of the
8 land. Noise-sensitive land uses typically include residences, hospitals, schools,
9 guest lodging, libraries, and certain types of recreational uses. The existing and
10 potential future noise-sensitive uses in the expansion area include the following.

- 11 ■ The BMK residential development, located north of the restoration site
12 (construction activity on or adjacent to the south lagoon levee on the northern
13 perimeter of BMKV could occur within 150 to 300 feet from the nearest
14 residences to the south lagoon levee; most construction would occur further
15 from the BMK residential community on other portions of BMKV)
- 16 ■ The Hamilton residential development, located south of the restoration site
17 (construction activity along the southern HAAF–BMKV perimeter would be
18 within about 1,250 feet, at the closest, to this development)
- 19 ■ Public uses of the future Bay Trail

20 **Existing Noise Conditions**

21 Ambient sound levels associated with noise-sensitive land uses in the vicinity of
22 the expansion site vary depending on the proximity of major existing noise
23 sources such as traffic, aircraft, and industrial uses. Ambient sound levels in
24 similar suburban/rural settings are typically in the range of 40 to 60 dBA. Noise
25 levels were measured in 1991 as part of the 1993 EIR prepared for the prior
26 proposed development at BMKV (see table 4-20). Development in the BMK
27 community or on the BMKV property itself has not changed since 1991, so these
28 measurements are felt to reasonably represent the ambient noise levels present at
29 the site.

3

Noise Standards and Regulation

4
5
6

Various federal, state, and local agencies have developed guidelines for evaluating land use compatibility under different sound-level ranges. These guidelines are summarized below:

7

Federal Guidelines

8
9
10

The federal Noise Control Act of 1972 established a requirement that all federal agencies administer their programs to promote an environment free of noise that jeopardizes public health or welfare. The EPA was given the responsibility for:

11
12
13
14
15
16
17

- providing information to the public regarding identifiable effects of noise on public health or welfare,
- publishing information on the levels of environmental noise that will protect public health and welfare within an adequate margin of safety,
- coordinating federal research and activities related to noise control, and
- establishing federal noise-emission standards for selected products distributed in interstate commerce.

18
19
20
21
22

The EPA identified indoor and outdoor noise limits to protect against effects on public health and welfare. Outdoor limits of 55 dB-Ldn and indoor limits of 45 dB-Ldn are identified as desirable to protect against speech interference and sleep disturbance for residential areas and areas with educational and healthcare facilities.

23
24
25
26
27

The U.S. Department of Housing and Urban Development has established guidelines for evaluating noise impacts on residential projects. Sites are generally considered acceptable if they are exposed to outdoor noise levels of 65 dB-Ldn or less, normally unacceptable if they are exposed to levels of 65–75 dB-Ldn, and unacceptable if exposed to levels of 75 dB-Ldn or greater.

1 **State Guidelines**

2 In 1987, the California Department of Health Services published guidelines for
3 the noise elements of local general plans. These guidelines include a sound
4 level/land use compatibility chart that categorizes various outdoor Ldn ranges by
5 land use. These guidelines identify the normally acceptable range for low-
6 density residential uses as less than 65 dB and conditionally acceptable levels as
7 55–70 dB.

8 **Local Guidelines**

9 The Marin County General Plan (1994) established noise level performance
10 standards for stationary sources for areas within the county. Table 4-21
11 summarizes the county’s standards. However, it should be noted that there
12 would be no stationary noise sources associated with the restoration after
13 construction is completed. During construction, there would be mobile sources
14 associated with vehicles but no fixed stationary sources other than the electrical
15 off-loading pumps which would be located in San Pablo Bay, far from any
16 sensitive receptor.

17 **Table 4-21.** Allowable Noise Exposure from Stationary Noise Sources in
18 Marin County

	Daytime (7:00 a.m. to 10:00 p.m.)	Nighttime (10:00 p.m. to 7:00 a.m.)
Hourly dB (L _{eq})	50	45
Maximum Level	70	65
Maximum level (Impulsive Noise)	65	60

Source: Marin Countywide Plan, 1994

19
20 Marin Countywide Plan policy N-2.4 requires measures to be taken to minimize
21 the exposure of neighboring properties to excessive noise levels from
22 construction-related activity. Under Program N-2.4a, the Marin County
23 Community Development Department reserves the right to set hours for
24 construction-related activities that involve the use of machinery, power tools, or
25 hammering. The Marin Countywide Plan identifies, in general, that residential
26 areas should not be exposed to sound levels greater than 60 dBA. However, this
27 guidance is primarily concerned with the location of new development, rather
28 than temporary construction noise.

29 The City of Novato’s General Plan (2000) has established the following noise
30 level performance standards for areas within the city. Table 4-22 summarizes the

1 city’s standards. The city’s Noise Ordinance prohibits noise between the hours
2 of 10:00 p.m. and 6:00 a.m. The BMKV site is not within the City of Novato,
3 but the Hamilton residential development is within the city limits.

4 **Table 4-22.** City of Novato Noise and Land Use Compatibility Standards

Land Use Category	Maximum allowable noise level
Residential Development	Up to 60 dB
Transient Lodging: Motel and Hotel	Up to 60 dB
School, Library, Church, Hospital and Nursing Home	Up to 60 dB
Auditorium, Concert Hall, Amphitheater	Up to 70 dB
Sports Arena, Outdoor Spectator Sports	Up to 70 dB
Playgrounds, Neighborhood Parks, Open Space	Up to 65 dB
Golf Course, Cemetery	Up to 70 dB
Office Building, Business, Commercial & Professional	Up to 70 dB
Industrial, Manufacturing, Utilities	Up to 70 dB

Source: City of Novato General Plan 2000

5 **Environmental Consequences and Mitigation** 6 **Measures**

7 **Approach and Methods**

8 Noise impacts were evaluated by comparison of anticipated noise levels with
9 reference noise levels developed by EPA, the distances to sensitive noise
10 receptors, and local noise guidelines. Noise levels were measured in A-weighted
11 decibels (dBA), a composite frequency-weighting scheme that approximates the
12 way the human ear responds to sound levels.

13 **Impact Mechanisms**

14 Construction activities associated with restoration could intermittently generate
15 elevated noise levels on and adjacent to construction sites within the expansion
16 area. Offshore pile-driving activity associated with potential off-loader and
17 booster-pump platforms is discussed separately from onshore construction
18 activity.

19 Onshore construction activities associated with the restoration would include
20 demolition, grading and earthmoving activities, hauling materials, building

1 structures, and pumping activities. Existing noise-sensitive land uses located in
2 the vicinity of the construction activity could be exposed to construction noise.

3 Table 4-23 summarizes typical noise levels produced by onshore construction
4 equipment commonly used for development of wetland restoration sites. As
5 indicated, equipment involved in construction is expected to generate noise levels
6 ranging from 76 dB to 89 dB at a distance of 50 feet. Noise produced by
7 construction equipment would be reduced at a rate of about 6 dB per doubling of
8 distance.

9 **Table 4-23.** Construction Equipment Noise Emission Levels

Equipment	Typical Noise Level (dBA) 50 ft from Source
Backhoe	80
Compactor	82
Crane, Derrick	88
Crane, Mobile	83
Dozer	85
Grader	85
Loader	85
Paver	89
Pump	76
Scraper	89
Truck	88

Source: U.S. Department of Transportation,
Federal Transit Administration 1995.

10

11 A reasonable worst-case assumption for onshore construction is that the 3 loudest
12 pieces of equipment would operate simultaneously and continuously over at least
13 a 1-hour period. The combined sound level of 3 of the loudest pieces of
14 equipment listed in table 4-23 (paver, scraper, and truck) is 93-dBA measured at
15 50 feet from the source. Table 4-24, which assumes this combined source level,
16 summarizes predicted noise levels at various distances from an active
17 construction site. These estimations of noise levels take into account distance
18 attenuation, attenuation from molecular absorption, and anomalous excess
19 attenuation (Hoover 1996). The results in table 4-24 indicate that the resultant
20 worst-case sound levels of greater than 60 dBA could occur within about 1,500
21 feet. Operation of a single piece of equipment, such as a scraper, could result in
22 sound levels greater than 60 dBA within about 1,000 feet.

1
2

Table 4-24. Estimated Onshore Construction Noise in the Vicinity of an Active Construction Site

Distance Attenuation		Sound Level at Receptor (dBA)
Distance to Receptor (feet)	Combined Equipment	Single Piece of Equipment (e.g. Scraper)
50	93	89
100	87	83
200	81	77
500	72	68
600	71	66
800	68	64
1,000	65	61
1,500	61	57
2,000	58	54
2,500	55	51
3,000	52	48
4,000	48	44
5,280	44	40
7,500	37	33

The following assumptions were used:

Basic sound level drop-off rate:	6.0	dB per doubling of distance
Molecular absorption coefficient:	0.7	dB per 1,000 feet
Anomalous excess attenuation:	1.0	dB per 1,000 feet
Reference Sound Level (Combined)	93	dBA
Reference Sound Level (Single)	89	dBA
Distance for Reference Sound Level:	50	Feet

Notes:

This calculation does not include the effects, if any, of local shielding, which may reduce sound levels further.

3
4
5
6
7
8
9
10

Pile-driving may be conducted offshore for the off-loader and booster-pump platforms. Approximately thirty 36-inch diameter piles may be driven over a 1-month period using a pile-driving hammer with a power of approximately 110 to 220 kJ. The off-loading facility would be located approximately 30,000 feet from the expansion restoration site, at approximately the -24- to -28-foot MLLW. The booster-pump platform would be located offshore between the off-loading facility and the shoreline. Impact pile drivers can have typical noise

1 levels in excess of 100 dBA at 50 feet, depending on size (U.S. Department of
2 Transportation, Federal Transit Administration 1995).

3 **Thresholds of Significance**

4 The following significance criteria were used to evaluate the proposed BMKV
5 expansion. Regarding noise, the proposed expansion was identified as resulting
6 in a significant impact on the environment if it would

- 7 ■ increase noise levels to greater than 60 dBA in residential areas adjacent to
8 the site, or
- 9 ■ increase noise levels by 3 dBA in areas where noise levels already exceed
10 60 dBA.

11 **Impacts and Mitigation Measures of No-Action** 12 **Alternative**

13 Under the No-Action Alternative, construction of the proposed BMKV expansion
14 would not occur, and no new noise sources would be created.

15 **Impacts and Mitigation Measures Common to** 16 **Alternatives 1–3**

17 **Impact N-1: Potential Increases in Traffic Noise Levels**

18 Implementation of the proposed BMKV expansion would result in increases in
19 traffic associated with construction and operation of the restoration site. Because
20 materials for levee construction are available onsite, traffic generated during the
21 construction phase would consist primarily of workers commuting to the site.
22 The low number of these daily trips is not expected to affect noise conditions in
23 the area crossed by the proposed access easement. Therefore, the impact on
24 sensitive noise receptors as a result of increased traffic during the construction is
25 considered less than significant.

26 After the construction of the BMKV expansion is completed, traffic on the site
27 would consist of trips made for maintenance and monitoring purposes in addition
28 to recreational users. Trips made for maintenance and monitoring purposes
29 would be infrequent and would not affect post-construction noise levels.
30 Although no formal recreation use plan has been developed for the site, the
31 number of trips made for recreational purposes is not expected to substantially
32 increase. Therefore, the impact on sensitive noise receptors as a result of
33 increased traffic during operation is considered less than significant.

Impact N-2: Temporary Increases in Noise Levels to more than 60 dBA during Onshore Construction

As described above, implementation of the proposed BMKV expansion could result in temporary noise levels exceeding 60 dBA at distances up to 1,500 feet due to combined equipment activity and at distances up to 1,000 feet from single equipment activity associated with grading and other ground disturbing construction activities. Most of the BMKV site is below grade because of subsidence; restoration construction activity within the center of the site is likely to be below the elevation of the perimeter levees. However, construction activity on the northern or southern levees could be on a similar elevation to nearby residences in the BMK and Hamilton residential areas.

Sensitive noise receptors during construction include residences in these 2 areas. Construction activity could occur in the range of 150–300 feet from the nearest BMK residence when working on or near the south lagoon levee and within 1,250 feet from the nearest Hamilton residences when working on the HAAF–BMKV levee. Due to the distance to the Hamilton residential development and the existence of the New Hamilton Partnership levee (elevation 8 to 12 feet NGVD) on the western side of the former airstrip, no significant impacts are expected for the Hamilton residences. Although the impact to some of the nearest BMK residences would be temporary, this impact is considered significant. To reduce this impact to a less-than-significant level, the following mitigation measure would be implemented:

Mitigation Measure N-1: Employ Noise-Reducing Construction Practices.

To reduce noise levels to the maximum extent practicable, the wetland construction contractor will employ the following noise-reducing construction practices.

- During construction phases, the contractor will ensure that construction is performed in accordance with applicable City and County noise standards. No noise generating construction or repair work within 1,000 feet of residences will be performed between the hours of 10:00 p.m. and 7:00 a.m. on any weekday, Sunday, or legal holiday.
- During construction phases, earthmoving within 300 feet of an occupied residence will only be performed during normal daylight hours (8:00 a.m. to 5:00 p.m.), Monday through Saturday, wherever feasible.
- Mufflers should be kept operable and effective on all construction equipment, generators, and vehicles. All internal combustion engines must be operated with exhaust and intake silencers. Wherever possible, noise-generating construction equipment should be shielded from nearby residences by noise-attenuating buffers such as structures or truck trailers.
- Prior to construction within 1,000 feet of residences, written notice should be provided to potentially affected residences identifying the type, duration, and frequency of construction activities. Notification materials will also identify

1 a mechanism for residents to register complaints if construction noise levels
2 are overly intrusive or construction occurs outside the required hours.

- 3 ■ Construction staging area(s) and stockpile areas will be located at least 1,000
4 feet from occupied residences, or contractors will be required to provide
5 appropriate noise-reducing engine-housing enclosures. Equipment warm-up
6 areas, water tanks, and storage areas should be located in the established
7 staging area or in other portions of the expansion site more than 1,000 feet
8 from existing residences as feasible.

- 9 ■ Throughout the construction period, the contractor will implement
10 appropriate additional noise mitigation measures, including, but not limited
11 to, changing the location of stationary construction equipment, shutting off
12 idling equipment, rescheduling construction activity, or installing temporary
13 barriers around stationary construction noise sources at the request of the
14 City or County.

15 **Impact N-3: Temporary Increase in Noise Levels due to** 16 **Offshore Pile-Driving**

17 Pile-driving may be conducted offshore as part of construction of the off-loading
18 facility and the booster-pump platform. The off-loading facility would be located
19 more than 1 mile from the nearest shoreline and any associated residences.
20 Assuming the pile-driving equipment resulted in an impulse noise level of 101
21 dBA at 50 feet, the noise level of pile driving would attenuate to less than 60
22 dBA within 4,800 feet of the pile-driving location, which is not near any
23 residential areas. This impact is considered less than significant. Impacts to
24 marine mammals and sensitive fish species is discussed separately above in the
25 *Biological Resources* section of this chapter.

26 **Impacts and Mitigation Measures Unique to Alternative** 27 **1 and Revised Alternative 2**

28 **Impact N-4: Increased Noise from Use of Hydraulic Off-** 29 **Loaders and Supplemental Booster Pumps**

30 Under Alternative 1, electric-powered or diesel-powered hydraulic off-loaders
31 would be located approximately 24,000 feet (4.5 miles), respectively, offshore.
32 The equipment would not contribute significantly to ambient noise levels onshore
33 because of their relatively low noise level during operation and due to their
34 relative distant location from sensitive receptors onshore. Similarly, electric-
35 powered or diesel-powered supplemental booster pumps, which would also be
36 located offshore, would not contribute significant increases in the ambient noise
37 levels onshore. Because of the distance between the off-loaders and sensitive
38 noise receptors, noise levels at sensitive receptors would be fall below desirable

1 limits. The impact on sensitive noise receptors as a result of off-loading
2 equipment during construction is considered less than significant.

3 **Impacts Unique to Alternative 3**

4 **Impact N-5: Increased Noise from Use of Relief Pump(s)**

5 Under Alternative 3, an electric-powered or diesel-powered pump or pumps
6 would be located along the levee east of the existing BMK south lagoon lock at
7 the pump station (see figure 3-8). The specific size and type of equipment for
8 these pumps has not been determined. The purpose of a pump or pumps would
9 be to accommodate the existing BMK CSD easement for overflow when the
10 lagoon reaches an elevation of 1.5 feet NGVD. Alternative 3, unlike Alternative
11 1 and Revised Alternative 2, does not contain a swale to receive lagoon overflow,
12 and thus a pump would be necessary to take the overflow. The levee along the
13 east side of the lagoon is relatively close to the existing houses that are at the end
14 of Bel Marin Keys Boulevard and Bahama Reef. The pumps would only be
15 expected to operate during storm events when the south lagoon could not be
16 drained due to high stage in Novato Creek and thus noise impacts would
17 expected to be temporary in nature. As this facility has not been designed, it is
18 unknown what kind of shielding would be placed around the pumps or what kind
19 of structure the pump station would be. As such, this impact is considered a
20 potentially significant though temporary impact, when the pumps actually are
21 operated. If Alternative 3 were selected, the following mitigation is
22 recommended to reduce this impact to less than significant.

23 **Mitigation Measure N-2: Employ Noise-Reducing Design if the Pump 24 Station in Alternative 3 Is Built.**

25 To reduce noise levels associated with pump operation, an engineering noise
26 assessment would be conducted to determine the appropriate design features to
27 reduce noise impacts to nearby residences. These design features may include,
28 but are not limited to: pump size; pump station building construction; localized
29 pump engine shielding; use of electrical pumps; and/or positioning of the pumps
30 below the levee crest on the east side (if feasible).

1 Cultural Resources

2 Introduction

3 An archaeological and architectural investigation was conducted in compliance
4 with the requirements of CEQA, NEPA, and Section 106 of the National Historic
5 Preservation Act (NHPA) for the proposed BMKV expansion. This section
6 represents the results of the cultural resources investigation.

7 Data Sources

8 A records search conducted at the Northwest Information Center of the
9 California Historical Resources Information System resulted in the identification
10 of several prehistoric archaeological sites that have been recorded within a 0.5-
11 mile radius of the expansion area (Nelson 1909). However, no prehistoric
12 archaeological sites have been identified in the proposed expansion area.
13 Previous studies within the area of potential effect (APE) (Archaeological
14 Consulting and Research Services 1979, Flynn 1978, Shannon 1992) did not
15 result in the identification of prehistoric resources. There are many previously
16 recorded prehistoric sites close to the expansion area, all of which have been
17 found on the low terraces, at a slight elevation above sea level (Nelson 1909). In
18 1909, Nelson reported on several sites located north and south of the expansion
19 area. These sites are primarily prehistoric occupation sites and locations where
20 the native population procured food and other resources. Shannon (1992)
21 identified several historic and architectural resources within the expansion area
22 and provided some indication for sensitivity.

23 A letter was sent to the Native American Heritage Commission (NAHC)
24 requesting that they consult their sacred lands file and send a list of individuals
25 and organizations that may have knowledge of properties of cultural or religious
26 importance to Native Americans in the expansion area. The search of the sacred
27 lands file revealed no Native American cultural properties within the expansion
28 area, and a letter was sent to each individual and organization identified on the
29 NAHC list. To date, no responses have been received.

30 In an effort to identify important historic people, events, and architectural trends
31 that may have been associated with the project area, a Jones & Stokes historian
32 conducted archival research at the following locations.

- 33 ■ County of Marin Assessor's Office
- 34 ■ County of Marin Recorder's Office
- 35 ■ California State Library, Sacramento
- 36 ■ Division of Mines and Geology Library, Sacramento

- 1 ■ California State Lands Commission
- 2 ■ Marin County Civic Center Library
- 3 ■ Novato History Museum

4 Previous reports that were consulted include the following.

- 5 ■ *Hamilton Wetland Restoration Plan Final Environmental Impact*
6 *Report/Environmental Impact Statement* (Jones & Stokes 1998);
- 7 ■ National Register of Historic Places Evaluation, Hamilton Army Air Field
8 Historic District, Marin County, California (PAR Environmental Services,
9 Inc. 1993);
- 10 ■ *Bel Marin Keys V Final Environmental Impact Report/Environmental Impact*
11 *Statement* (Environmental Science Associates 1993);
- 12 ■ Archaeological Impact Evaluation of Two Non-Contiguous Parcels of Land
13 Near Ignacio, Marin County (Archaeological Resource Service 1978).

14 Field Surveys

15 Archaeology

16 A Jones & Stokes archaeologist conducted pedestrian field surveys at the
17 expansion site on January 17 and 18, 2002, February 25, 2002, and August 1 and
18 2, 2002. The multiple surveys were conducted in a manner that allowed portions
19 of the expansion site to be viewed. During the surveys, the levees around the
20 circumference of the property were walked in a linear manner. Areas around
21 historic structures and areas of suspected historic activity were investigated using
22 intensive transects spaced no farther than 10 meters apart. No other areas
23 appeared to have sensitivity for the presence of archaeological resources.

24 The proposed Bay Trail alignment in Alternative 1, the Pacheco Pond outlet
25 channel, and the Conservancy-owned parcel north of Bel Marin Keys boulevard
26 were surveyed on August 1 and 2, 2002. A pedestrian survey was conducted
27 from the base of Ammo Hill to Bel Marin Keys Boulevard along the proposed
28 Bay Trail route in Alternative 1. Approximately 50% of this area was found to
29 be covered with dense grasses and dense marsh vegetation, and there was low
30 visibility throughout the area in general. The area appears to be one of low
31 sensitivity for the presence of archaeological remains. The Pacheco Pond outlet
32 channel on the northern side of Bel Marin Keys Boulevard, was covered in
33 heavy vegetation, including impenetrable blackberry bushes, and the visibility in
34 this area was generally low.

Built Environment

A Jones & Stokes architectural historian conducted field surveys of the project site on January 9, 2002, and August 1, 2002. The survey area included the BMKV parcel, the SLC parcel, the Bay Trail route proposed under Alternative 1, the Pacheco Pond outlet channel, and the Conservancy owned parcel north of Bel Marin Keys Boulevard. As part of the field process, buildings and structures in the APE were inspected and photographed, and notes were gathered.

Determination of Significance of Cultural Resources

Historical resources are defined as buildings, sites, structures, objects, or districts, each of which may have historical, architectural, archaeological, cultural, or scientific significance.

Prior to the assessment of effects or the development of mitigation measures, the significance of cultural resources must be determined. The steps that are normally taken in a cultural resources investigation for CEQA compliance are:

- identify potential historical resources,
- evaluate the eligibility of historical resources,
- evaluate the effects of a project on all eligible historical resources.

Because the federal trigger for NEPA also triggers Section 106 of NHPA (36 CFR et. seq.), the 2 compliance processes can be coordinated.

Section 106 of the NHPA requires that, before beginning any undertaking, a federal agency must take into account the effects of the undertaking on historic properties and afford the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on these actions. The Section 106 process has 6 basic steps.

- Initiate consultation and public involvement
- Identify and evaluate historic properties
- Assess effects of the project on historic properties
- Consult with the State Historic Preservation Officer (SHPO) regarding adverse effects on historic properties, resulting in a memorandum of agreement (MOA)
- Submit the MOA to the ACHP
- Proceed in accordance with the MOA

The assessment of impacts presented in this section applies the Criteria of Effect and Adverse Effect, as defined by the NHPA. Because these criteria are

1 consistent with the criteria for determining impacts for both CEQA and NEPA,
2 this section will be used to document the effects of the proposed wetland
3 restoration for the purpose of CEQA, NEPA, and Section 106. Specific
4 regulations regarding compliance with Section 106 state that, although the tasks
5 necessary to comply with Section 106 may be delegated to others, the federal
6 agency (in this case, the Corps) is ultimately responsible for ensuring that the
7 Section 106 process is completed according to statute.

8 **Cultural Resource Significance Criteria**

9 CEQA guidelines define 3 ways that a property can qualify as a significant
10 historical resource for the purposes of CEQA review.

- 11 ■ If the resource is listed in or determined eligible for listing in the California
12 Register of Historical Resources (CRHR)
- 13 ■ If the resource is included in a local register of historical resources, as
14 defined in section 5020.1(k) of the Public Resources Code, or identified as
15 significant in a historical resource survey meeting the requirements of section
16 5024.1(g) of the Public Resources Code unless the preponderance of
17 evidence demonstrates that it is not historically or culturally significant
- 18 ■ If the lead agency determines the resource to be significant as supported by
19 substantial evidence in light of the whole record (California Code of
20 Regulations, Title 14, Division 6, Chapter 3, section 15064.5)

21 For a historical resource to be eligible for listing in the CRHR, it must be
22 significant at the local, state, or national level under 1 or more of the following 4
23 criteria.

- 24 ■ It is associated with events that have made a significant contribution to the
25 broad patterns of local or regional history, or the cultural heritage of
26 California or the United States.
- 27 ■ It is associated with the lives of persons important to local, California, or
28 national history.
- 29 ■ It embodies the distinctive characteristics of a type, period, region, or method
30 of construction, or represents the work of a master, or possesses high artistic
31 values.
- 32 ■ It has yielded, or has the potential to yield, information important to the
33 prehistory or history of the local area, California, or the nation.

34 Historical resources automatically listed in the CRHR include those historic
35 properties listed in, or formally determined eligible for listing in, the National
36 Register of Historic Places (NRHP) (PRC section 5024.1).

37 Because the proposed wetland restoration must comply with NEPA and Section
38 106 of the NHPA, federal significance criteria are also applied in the following

1 analysis. For federal projects, cultural resource significance is evaluated in terms
2 of eligibility for listing in the NRHP. NRHP criteria for eligibility are defined as
3 follows:

4 The quality of significance in American history, architecture, archeology, and
5 culture is present in districts, sites, buildings, structures, and objects of state and
6 local importance that possess integrity of location, design, setting, materials,
7 workmanship, feeling and association, and that:

- 8 ■ are associated with events that have made a contribution to the broad pattern
9 of our history;
- 10 ■ are associated with the lives of people significant in our past;
- 11 ■ embody the distinct characteristics of a type, period, or method of
12 construction, or that represent the work of a master, or that possess high
13 artistic values, or that represent a significant and distinguishable entity whose
14 components may lack individual distinction; or
- 15 ■ have yielded, or are likely to yield, information important in prehistory or
16 history (36 CFR 60.4).

17 In addition to meeting the significance criteria described above, a significant
18 property must possess “integrity” to be considered eligible for listing in the
19 NRHP. *Integrity* refers to a property’s ability to convey its historic significance
20 (National Park Service 1991). Integrity is a quality that applies to historical
21 resources in 7 specific ways: location, design, setting, materials, workmanship,
22 feeling, and association. To be considered eligible for listing in the NRHP, a
23 resource must possess at least 2 of these kinds of integrity qualities, and usually
24 more depending on the context and the reasons why the property is significant.

25 The NRHP criteria limit the consideration of moved properties because
26 significance is embodied in locations and settings. Under NRHP criteria
27 consideration B, a moved building lacks the integrity of location and setting and
28 would typically be considered ineligible for listing. A moved property can be
29 eligible if it is significant primarily for architectural value, or if it is the surviving
30 property most importantly associated with a historic person or event (U.S.
31 Department of Interior 1991).

32 Affected Environment

33 Prehistory

34 Nels C. Nelson was the first archaeologist to survey the coastline of San
35 Francisco Bay. Nelson’s survey, which included the Marin Coast, was conducted
36 between 1906 and 1908 and documented 425 shellmounds along the coast from
37 the Russian River in Sonoma County to Half Moon Bay in San Mateo County
38 (Nelson 1909). Numerous shellmounds occur within a short distance of the

1 proposed expansion area—to the north and south. Nelson’s primary concerns
2 were the distribution, condition, number, and constituents of the shellmounds,
3 which might infer the age and amounts of inhabitants who occupied the sites
4 (Moratto 1974: 63; Nelson 1909). Nelson also recognized the intensive use of
5 shellfish throughout the coastal middens as evidence for a distinct economic base
6 of the region (Moratto 1984: 227). Nelson also performed the first investigations
7 at 3 shellmounds in eastern Marin County in 1909 and 1910.

8 By 1916, 11 of the sites identified by Nelson had been excavated. Advances
9 were made in archaeological dating methods, and in the 1930s, researchers
10 applied these new techniques to distinguish temporally and culturally discrete
11 assemblages of shell beads and ornaments. More recently, new techniques were
12 developed for determining obsidian sources and exchange routes among different
13 Native American groups throughout California and beyond. In addition, obsidian
14 hydration and radiocarbon dating have been instrumental in establishing dates of
15 occupation for many of the sites within San Francisco Bay Area. Information on
16 human occupation prior to 5000 B.P. is almost non-existent because of the
17 depositional environment of the region and dramatic environmental changes
18 which took place their at this time.

19 Results from previous archaeological investigations within the expansion area
20 and the surrounding region have shown that the San Francisco Bay Area was
21 inhabited by mobile hunter-gatherers. Over time, their foraging strategies
22 became more focused on the locally obtainable resources, and their lives became
23 increasingly more sedentary. Early inhabitants of the expansion area relied
24 heavily on the resources associated with San Pablo Bay and associated marshes
25 and estuarine environments. Several archaeological sites associated with past use
26 are found near the expansion area and generally inland of the expansion site;
27 most are situated above the historic marshlands.

28 The vast majority of the expansion area is comprised of agricultural fields, which
29 were once marshland prior to the construction of the levees in the early part of
30 the 20th century. For the past several thousand years, the property existed as
31 tidal marshlands. Before that time, when sea levels of the San Francisco Bay
32 were considerably lower than they are today (Bickel 1978), the prehistoric
33 environmental setting of the area was very different. Prior to the marshland
34 environment, the sea level was considerably lower, and therefore the expansion
35 area could well have been a littoral zone where Native Americans lived and
36 procured marine and bayshore resources. Inundation and sedimentation
37 associated with sea level rise resulted in subsequent deposition of bay mud on the
38 expansion site. Based on cone penetrometer testing conducted in 1991, the depth
39 of bay mud across the site is between 28 and 99 feet (Environmental Science
40 Associates 1993). It is possible that due to the prehistoric use of the site when it
41 was a littoral zone, prehistoric archaeological resources may be present beneath
42 the bay mud layer.

Ethnography

The expansion area was inhabited by the Coast Miwok Indians in the prehistoric past and at the time of European contact. The Coast Miwok language, a member of the Miwokan subfamily of the Utian family, is divided into 2 dialect groups: Western (Bodega) and Southern (Kelly 1978: 414; Shipley 1978: 84). The Coast Miwok territory extended from Duncan's Point on the Sonoma County Coast to the end of the Marin County Peninsula (Kroeber 1925). To the east, Coast Miwok territory extended east as far as midway between the Sonoma and Napa Rivers (Kelly 1978).

The main tribelet in the expansion area was the Omiomi group, which inhabited the valley of Novato Creek on the northwest side of San Pablo Bay (Milliken 1995: 250). The Coast Miwok village of Puyuku is also situated within 1 mile of the expansion site. Coast Miwok villages were usually located near major inland watercourses or, in some cases, along the coast (Kelly 1978: 417).

Contact between the Coast Miwok and Europeans first occurred on the Marin County coast as early as 1579, when Sir Francis Drake spent 5 weeks on the Marin coast to repair his damaged ship (Kroeber 1953: 275). Spanish explorers made contact with the Coast Miwok in the late 1700s. By 1776, the Franciscan fathers of the San Francisco mission began forced conversions of Native Americans to Christianity and brought Coast Miwok to mission lands, causing a partial abandonment of native settlements. Subsequent ranching and settlement by Mexicans and Americans further displaced Coast Miwok from their homes and subjected the group to intense depredations of homicide and epidemic diseases (Bean and Rawls 1993: 17).

During the early years of U.S. dominance of California, some Coast Miwok took work in sawmills and as field hands (Kelly 1978: 414). Although the Coast Miwok population declined from approximately 2,000 persons before European contact to 5 individuals by 1920 (Cook 1976: 239), the National Park Service, the Miwok Archaeological Preserve, and individuals of at least partial Coast Miwok descent began recreating the village of Kule Loklo (Bear Valley) on the Point Reyes National Seashore. Dances and local festivals reflecting Coast Miwok traditions are now held at Kule Loklo (Eargle 1986: 67, 84–85). Additional ethnographic information about the Coast Miwok is included in a technical report (Jones & Stokes 2002b).

History

Marin County was one of the original 27 counties created when California became a state in 1850. It is dotted with numerous dairy farms, as well as poultry and stock-raising ranches. The Golden Gate National Recreational Area also makes up a sizeable portion of the county (Hart 1978: 259).

1 As early as the 1500s, Europeans such as Frances Drake and Sebastian Rodriguez
2 Cermeno explored the region. Spain established Mission San Rafael in present-
3 day San Rafael in 1817. After 1822, Mexico gained independence from Spain
4 and began allowing its citizens land grants throughout Alta California. In 1848,
5 the United States defeated Mexico in the Mexican-American War and Mexico
6 surrendered its Alta California land in the Treaty of Guadalupe Hidalgo.
7 Livestock grazing in addition to agricultural and dairy farming comprised the
8 principal industries during this period (Hoover 1990: 172–174, Mason 1975:
9 156).

10 Once California became a state, it assumed ownership of much of the land within
11 its borders including lands under navigable streams, lakes, or harbors, land
12 acquired through purchase, condemnation, or gift, or that which was obtained
13 through rancho land title disputes. In addition, through the Swampland Act of
14 September 28, 1850 (also known as the Arkansas Act), the federal government
15 granted California public land throughout the state (amounting to over 2-million
16 acres) that was subject to overflow and therefore unprofitable for agricultural use
17 unless reclamation work was undertaken (Robinson, 1948: 191–192). With
18 federal assistance, the swamp and overflow land was identified, surveyed,
19 certified, and then patented to the state. The state, in turn, issued a state patent to
20 future swampland purchasers.

21 The expansion area, a historic marshland, was part of this swamp and overflow
22 acreage. California issued patents for land within the APE in 1863 to Henry
23 Hansen and in 1876 to L.C. McAfee (Marin County Recorder's Office
24 1868:187–189, 1876b: 565). E. B. Perrin eventually assumed ownership of
25 Hansen and McAfee's property and sold it to John W. Ferris by 1878 (Shannon
26 1992). In 1892, John W. Ferris a civil engineer and swampland developer from
27 the Central Valley, increased his land holdings by purchasing over 500 additional
28 acres of swampland (including the expansion area) along San Pablo Bay. The
29 state issued a patent to Ferris for his land in 1893 (Dodge 1892, Marin County
30 Recorder's Office 1893: 189).

31 Although Ferris owned vast amounts of acreage in the area, there is no evidence
32 that he actually resided in Marin County. In 1906, he married Emma Watson,
33 daughter of Claus Spreckels (a sugar tycoon) and moved to England (*San*
34 *Francisco Chronicle* 1920). Ferris retained ownership of his Marin County
35 property, including the study area, until 1912 when he sold it through an agent in
36 the states to Louis Friedlander and F. K. Houston of San Francisco (Marin
37 County Recorder's Office 1912: 356).

38 It is unclear when efforts were undertaken to reclaim land in the APE, although
39 early records indicate some reclamation measures were in place in the
40 northwestern part of the study area by 1876 (Marin County Recorder's Office
41 1876a: 473). By 1898, levees, ditches, and several out buildings were located
42 throughout the project area (Dickins 1898). Between 1910 and 1914, a pump
43 house was constructed in the eastern part of the project area along San Pablo Bay
44 (U.S. Geological Survey 1914, 1916). Although Ferris most likely undertook
45 many of the earlier drainage improvements, it is uncertain whether Ferris or

1 Friedlander and Houston were directly connected to the later changes, which
2 include the construction of the pump house. Ferris was the least likely candidate
3 for these changes as he was living abroad at that time. Upon purchasing the
4 property, it is probable that Friedlander and Houston rented the reclaimed land to
5 sharecroppers who used it to grow oats and barley (Shannon 1992).

6 In 1916, California Fruit Cannery received title to the property (known as Marin
7 Meadow) and transferred it to California Packing Corporation (Calpak) (now Del
8 Monte) (Marin County Recorder's Office 1917: 458–476). Calpak, a large fruit
9 processing company formed in 1916 from a handful of canners and marketers
10 (including California Fruit Cannery), vastly improved irrigation and drainage in
11 the study area to meet its large-scale operating needs. The company constructed
12 additional levees, ditches, and onsite wells, built or improved roads, and put in
13 place a handful of structures, including barns and residences. Over the next 30
14 years Calpak used the property to grow sugar beets, peas and other crops, as well
15 as breed stallions that were used in the farm operations (Jones & Stokes 1998,
16 Shannon 1992).

17 By 1948, Calpak sold the property to H. Ward Dawson. Within the next 20 years
18 the southern part of the SLC parcel was reclaimed and used by Hamilton Air
19 Force Base for an antenna field and firing range. Over time additional owners
20 included McAlester Construction Finance and Bel Marin Keys Development
21 Association. In 2001, the State of California purchased the land within the
22 expansion area. Agricultural use of the property still occurs but is limited to dry
23 farming of oat hay (Jones & Stokes 1998, Shannon 1992).

24 The U.S. military constructed Hamilton Field between 1931 and 1935 as a
25 bombardment base. As one of 3 such bases in the U.S. at the time, the airfield
26 played a vital role in the development of air defense mechanisms on the West
27 Coast in the 1930s and in the training and processing of military units in the early
28 1940s. From 1947 to 1960, the U.S. Air Force used the facility to conduct
29 defense and training operations and renamed it Hamilton Air Force Base. By the
30 early 1970s, the U.S. Navy and Coast Guard occupied the base, in conjunction
31 with the Air Force. In 1984, the base was conveyed to the U.S. Army and
32 renamed Hamilton Army Air Field. Shortly thereafter, the facility was
33 decommissioned and the land was transferred to private-sector ownership (PAR
34 Environmental Services, Inc. 1993).

35 **Summary of Known Cultural Resources in the APE**

36 Based on the methods described above, 2 historic-period sites and no prehistoric
37 sites have been identified within the proposed expansion area. In addition, a total
38 of 21 architectural resources (buildings, structures, and linear and landscape
39 features) were surveyed and evaluated as part of this study.

1

Historic Archaeology

2
3

The field surveys resulted in the identification of 2 historical resources, a historic trash deposit and the remnants of a demolished 1940s house.

4

Historic Trash Deposit

5
6
7
8
9
10
11
12
13
14

The historic trash deposit site comprises a large concentration of historic debris and household items that appear to date back to the 1920s–1940s. There is no evidence of a foundation or remnants of a structure at the trash deposit site. The site contains a concentration of materials scattered between the outboard side of the present-day BMKV outboard levee and the high-tide line on San Pablo Bay, several hundred yards south of the BMKV old pump house. It appears that the historic trash deposit is an intrusive secondary deposit, and at high tide, the site is completely submerged. The site has been evaluated for eligibility for listing in both the NRHP and the CRHR, but it does not meet the criteria of significance for listing in either register.

15

1940s House

16
17
18
19
20
21
22

The remnants of the demolished 1940s house are located at the top of the hill on the Conservancy-owned property north of Bel Marin Keys Boulevard, opposite from Headquarters Hill. According to historic maps and personal communication with a local landowner, a house was built at this site in the 1940s and was torn down in the early 1990s. The site has been evaluated for eligibility for listing in both the NRHP and the CRHR, but it does not meet the criteria of significance for listing in either register.

23

Prehistoric Archaeology

24
25
26
27
28
29
30
31
32
33

For the purposes and scope of the proposed BMKV expansion, the issue of deeply buried early (5,000 years old and older) prehistoric sites was not pursued further because the proposed BMKV expansion area is not expected to require excavation into the bay-mud layer, and therefore it is unlikely to reach horizons where prehistoric resources may be found. In addition, the current setting of the expansion area does not allow for a subsurface investigation of this research issue. The expansion area is currently below the mean sea level, and the present water table would make it impossible to conduct any kind of trenching or auguring to any depth with meaningful results. No prehistoric resources were identified during the limited field survey conducted within the expansion area.

34

Historic Architecture and Structures

35
36
37
38
39

A brief description and evaluation of NRHP and CRHR eligibility for each architectural resource and landscape and linear feature is presented below. The features located on the BMKV parcel are described below. The features described below for the SLC parcel (the Air Force antenna complex, the Air Force rifle range, and the new pump house) are part of the authorized HWRP.

1 Several additional identified features, located on adjacent parcels that may be
2 affected by the proposed project, are also described.

3 **Levee and Ditch System (BMKV Parcel)**

4 A system of levees and ditches is located throughout the BMKV parcel. The
5 system lacks integrity, and for this reason, it does not appear to meet the criteria
6 for listing in the NRHP or the CRHR.

7 **Overflow Structure (BMKV Parcel)**

8 An overflow structure is located in the northern part of the BMKV parcel.
9 Lacking historical and architectural significance, the structure does not appear to
10 meet the criteria for listing in the NRHP or the CRHR.

11 **Farm Complex (BMKV Parcel)**

12 A house, barn, and shed sheltered by a eucalyptus grove are located in the north
13 central part the BMKV parcel. The house and barn lack historical and
14 architectural significance. Therefore, they do not appear to meet the criteria for
15 listing in the NRHP or the CRHR. The shed also does not appear to be eligible
16 for listing in the NRHP or the CRHR because it does not meet the exceptional
17 significance criteria established for recently constructed properties. In addition,
18 the eucalyptus grove does not appear to meet NRHP or CRHR criteria because it
19 is a historic landscape feature associated with a structure that lacks historical
20 significance and therefore itself lacks historical significance.

21 **Old Pump House (BMKV Parcel)**

22 A pump house is located along the eastern boundary of the BMKV parcel,
23 adjacent to San Pablo Bay. The old pump house does not appear to meet the
24 criteria for listing in the NRHP or the CRHR because it lacks historical and
25 architectural significance.

26 **Barn (BMKV Parcel)**

27 A large barn is located in a eucalyptus grove directly northeast of Pacheco Pond.
28 The barn does not appear to meet the criteria for listing in the NRHP because the
29 structure was moved; it does not appear to meet the criteria for listing in the
30 CRHR because it lacks historical and architectural significance. The eucalyptus
31 grove also does not appear to be eligible for listing in the NRHP or CRHR
32 because it is a historic landscape features associated with a structure that lacks
33 historical significance, and therefore itself lacks historical significance.

34 **Air Force Antenna Complex (SLC Parcel)**

35 The remnants of an Air Force antenna complex are located in the center of the
36 SLC parcel. The complex includes an operations building, a generator building,
37 and seven 50-foot-tall poles topped by antennas. The buildings comprising the
38 antenna complex do not appear to meet the criteria for NRHP or CRHR
39 eligibility because they are less than 50 years old and do not meet the exceptional
40 significance criteria established for recently constructed properties.

1 **Air Force Rifle Range (SLC Parcel)**
2 A former rifle range (originally part of Hamilton Air Force Base) is located in the
3 southeast corner of the SLC parcel near San Pablo Bay. The range consists of a
4 target range, an ammunitions building, an administration building, a shed, and a
5 target practice field. The rifle range does not appear to be eligible for listing in
6 the NRHP or CRHR because it is less than 50 years old and does not meet the
7 exceptional significance criteria established for recently constructed properties.

8 **New Pump House (SLC Parcel)**
9 A concrete pump house is located west of the firing range. The building does not
10 appear on a 1981 map and most likely was constructed within the last 20 years
11 (U.S. Geological Survey 1959). It does not appear to be eligible for listing in the
12 NRHP or the CRHR because it does not meet the criteria of exceptional
13 significance for recently constructed buildings.

14 **Levee and Ditch System (Pacheco Pond Outlet)**
15 The Pacheco Pond outlet canal includes a system of levees and ditches. The
16 canal is located on the Leveroni property. The system lacks integrity, and for this
17 reason, it does not appear to meet the criteria for listing in the NRHP or the
18 CRHR.

19 **Tidal Gate (Pacheco Pond Outlet)**
20 A tidal gate, owned by MCFCWCD, is located at the end of the Pacheco Pond
21 outlet canal north of Bel Marin Keys Boulevard on the Leveroni property. It is
22 composed of board-formed concrete, with a series of 6 steel check gates. The
23 tidal gate does not appear to meet the criteria for listing in the NRHP or the
24 CRHR because it lacks historical and architectural significance.

25 **Ammunition Bunkers (Ammo Hill)**
26 Two concrete ammunition bunkers are located on Ammo Hill immediately
27 southwest of Perimeter Road which circles the base of the hill. This property
28 was formerly part of the Hamilton Air Force Base and was transferred to the City
29 of Novato in 1999 as part of the GSA Phase II Sale Area. These bunkers are
30 located adjacent to a part of the Bay Trail route in Alternative 1. In 1993, PAR
31 Environmental Services (PAR) evaluated the Hamilton Air Force Base resources
32 for NRHP eligibility. As part of its study, PAR defined the Hamilton Air Force
33 Base Historic District, which included the 2 ammunition bunkers (PAR
34 Environmental Services 1993). As part of this study, Jones & Stokes revisited
35 the bunkers to assess their integrity and to determine whether the 1993
36 evaluations were still valid. This report finds that NRHP eligibility findings still
37 pertain. The resources also appear to meet the criteria for listing in the CRHR.

Environmental Consequences and Mitigation Measures

Approach and Methods

The following describes the approach used to evaluate impacts on cultural resources associated with implementation of the proposed expansion project.

- Review project activities to identify those actions that may cause an impact on cultural resources.
- Determine whether those activities would occur at the location of significant resources, as described above.
- Apply the impact significance thresholds to determine the significance of impacts in those cases where project activities may affect significant resources.
- Identify measures that could avoid, reduce, eliminate, or compensate for significant impacts.

Impact Mechanisms

Ground-disturbing activities could adversely affect significant archaeological resources in the proposed BMKV expansion area. Ground-disturbing activities could also adversely affect previously unidentified prehistoric cultural resources in the proposed BMKV expansion area.

The demolition, alteration, or removal of significant buildings, structures, or linear and landscape features would constitute a significant impact. There are 2 significant structures in the project area.

Thresholds of Significance

Criteria for Determining Effects under CEQA

According to State CEQA guidelines, a project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment (CEQA rev. 1998 Section 15064.5(b)). CEQA further states that a substantial adverse change in the significance of a resource means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. Actions that would materially impair the significance of a historical resource are any actions that would demolish or adversely alter those physical characteristics of a

1 historical resource that convey its historical significance and qualify it for
2 inclusion in the CRHR or in a local register or survey that meet the requirements
3 of sections 5020.1(k) and 5024.1(g) of the Public Resources Code.

4 **Criteria for Determining Effects under Section 106**

5 Under federal regulations, a project has an effect on a historic property when the
6 undertaking could alter the characteristics of the property that may qualify the
7 property for inclusion in the NRHP, including alteration of location, setting, or
8 use. An undertaking may be considered to have an adverse effect on a historic
9 property when the effect may diminish the integrity of the property's location,
10 design, setting, materials, workmanship, feeling, or association. Adverse effects
11 on historic properties include, but are not limited to:

- 12 ■ physical destruction or alteration of all or part of the property;
- 13 ■ isolation of the property from or alteration of the property's setting when that
14 character contributes to the property's qualifications for listing in the NRHP;
- 15 ■ introduction of visual, audible, or atmospheric elements that are out of
16 character with the property or that alter its setting;
- 17 ■ neglect of a property resulting in its deterioration or destruction; or
- 18 ■ transfer, lease, or sale of the property (36 CFR 800.9).

19 **Impacts and Mitigation Measures of No-Action** 20 **Alternative**

21 Under the No-Action Alternative, no cultural resources would be disturbed.

22 **Impacts and Mitigation Measures Common to** 23 **Alternatives 1–3**

24 **Impact CR-1: No Impact to Known Significant** 25 **Architectural or Archaeological Resources**

26 Based on archival research and field investigations, implementation of these
27 alternatives would not impact any known significant architectural or
28 archaeological resources. The proposed BMKV expansion area does not appear
29 to have a high potential for the inadvertent discovery of archaeological resources.

Impact CR-2: Potential Impacts to Buried Cultural Deposits or Human Remains

Construction activity may encounter unexpected buried cultural deposits or human remains. This impact is considered significant. To reduce this impact to a less-than-significant level, the following mitigation measures would be implemented.

Mitigation Measure CR-1: Stop Work if Buried Cultural Deposits Are Encountered during Construction Activities.

If buried cultural resources, such as chipped stone or groundstone, historic debris, building foundations, or human bone, are inadvertently discovered during ground-disturbing activities, work will stop in that area and within a 100-foot radius of the find until a qualified archaeologist can assess the significance of the find.

Mitigation Measure CR-2: Stop Work if Human Remains are Encountered during Construction Activities.

If human skeletal remains are encountered, the county coroner will be contacted immediately. If the county coroner determines that the remains are Native American, the coroner will then be required to contact the NAHC (pursuant to Section 7050.5 (c) of the California Health and Safety Code) and the County Coordinator of Indian Affairs. A qualified Jones & Stokes archaeologist will also be contacted immediately.

If any human remains are discovered in any location other than a dedicated cemetery, there will be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

- the county coroner has been informed and has determined that no investigation of the cause of death is required; and
- if the remains are of Native American origin,
 - the descendants from the deceased Native Americans have made a recommendation to the landowner or the person responsible for the excavation work for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98; or
 - the NAHC was unable to identify a descendent or the descendent failed to make a recommendation within 24 hours after being notified by the commission.

According to the California Health and Safety Code, 6 or more human burials at 1 location constitute a cemetery (Section 8100), and disturbance of Native American cemeteries is a felony (Section 7052). Section 7050.5 requires that construction or excavation be stopped in the vicinity of discovered human remains until the coroner can determine whether the remains are those of a

1 Native American. If the remains are determined to be Native American, the
2 coroner must contact the NAHC.

3 **Impacts and Mitigation Measures Unique to** 4 **Alternative 1**

5 **Impact CR-3: Potential Cultural Resources Impacts** 6 **Resulting from Construction of the Bay Trail, Alternative 1**

7 Two architectural resources (ammunition bunkers) are located adjacent to the
8 Bay Trail route proposed under Alternative 1. The 2 bunkers were recommended
9 as eligible for the NRHP as contributors to the Hamilton Air Force Base Historic
10 District in 1993 by PAR Environmental Services (PAR Environmental Services
11 1993). Based on field investigations conducted by Jones & Stokes during 2002,
12 the NRHP eligibility findings still pertain, and the resources appear to meet the
13 CRHR criteria.

14 Both bunkers are constructed of concrete and are buried in the base of a partially
15 artificial hill known as Ammo Hill. The proposed trail alignment would be
16 located on top of an existing dirt road that runs adjacent to the bunkers and the
17 hill. Implementation of this project activity is not anticipated to cause the
18 physical destruction, relocation, or alteration of the bunkers and therefore would
19 not impair their ability to convey historical significance. Therefore, any
20 modification to the bunkers would not constitute a significant impact.

1 Aesthetics

2 Affected Environment

3 Data Sources

4 The evaluation of aesthetics is based on information contained in the *Bel Marin*
5 *Keys Unit 5 Final Environmental Impact Report/Environmental Impact*
6 *Statement* (Environmental Science Associates 1993), and information collected
7 during site visits conducted in Spring 2002.

8 Adjacent Land Uses

9 The BMKV site abuts San Pablo Bay along the site's entire eastern side. A
10 portion of the site's northeastern side lies adjacent to Novato Creek. On its
11 northern side, the site lies adjacent to the BMK housing development. On its
12 western side, the site is adjacent to Pacheco Pond. On its southwestern side, the
13 site borders the HAAF parcel. On its southeastern side, the BMKV parcel is
14 adjacent to the SLC parcel.

15 Viewer Groups

16 The primary viewers of the expansion site are the occupants of the BMK
17 residential homes that abut the edge of the BMKV parcel. Other viewers
18 includes pedestrians and roadway travelers who use the public streets.

19 There are no designated public scenic vista points in the BMK residential area in
20 close proximity to the south lagoon berm that separates the lagoon from BMKV
21 although the BMKV parcel is visible from the ends of public streets.

22 Key Viewpoints

23 Five key viewpoints were established in order to assess impacts to aesthetic
24 resources within the expansion area. Locations and directions of these
25 viewpoints are identified in figure 4-16 and described below. The view from
26 each of these viewpoints is also depicted in representative photographs shown in
27 figure 4-17.

1 **Viewpoint 1**

2 Viewpoint 1 is located at the eastern end of Bel Marin Keys Boulevard, adjacent
3 to the south lagoon lock structure. The view faces east towards San Pablo Bay.
4 The viewshed primarily consists of the south lagoon in the foreground (including
5 the boat lock), flat farmland and a utility tower in the middle ground, and isolated
6 hills in the background. San Pablo Bay is a small portion of the background view
7 from street level/ground floor but is prominent from the second-story level. The
8 view of the bay is partially obstructed by the existing outboard levee.

9 **Viewpoint 2**

10 Viewpoint 2 is located south of Viewpoint 1, at the eastern end of Bahama Reef
11 in the BMK residential area. The view faces east towards San Pablo Bay. The
12 viewshed primarily consists of the south lagoon in the foreground and flat,
13 vegetated land in the middle ground and background. Views from this viewpoint
14 are clear and unobstructed by utilities or other physical structures. San Pablo
15 Bay is a small portion of the background view from street level/ground floor but
16 is prominent from the second-story level. The view of the bay is partially
17 obstructed by the existing outboard levee.

18 **Viewpoint 3**

19 Viewpoint 3 is located southwest of Viewpoint 2, at the southeastern end of Del
20 Oro Lagoon in the BMK residential area. The view faces southeast towards
21 HAAF and San Pablo Bay. The viewshed primarily consists of the south lagoon
22 in the foreground, flat farmland in the middle ground, and isolated trees (on the
23 SLC parcel) and distant rolling hills in the background. Views from this
24 viewpoint are clear and unobstructed by utilities or other physical structures. San
25 Pablo Bay is a small portion of the background view from street level/ground
26 floor but is prominent from the second-story level. The view of the bay is
27 partially obstructed by the existing outboard levee.

28 **Viewpoint 4**

29 Viewpoint 4 is located southwest of Viewpoint 3, at the end of Dolphin Isle in
30 the BMK residential area. The view faces southeast towards HAAF. The
31 viewshed primarily consists of the south lagoon in the foreground, an isolated
32 tree and old farmhouse structure in the middle ground, and distant views of flat
33 farmland and rolling hills in the background. Views from this viewpoint are non-
34 contiguous. San Pablo Bay is barely visible from street level/ground floor but is
35 prominent from the second-story level. The view of the bay is partially
36 obstructed by the existing outboard levee.

1 **Viewpoint 5**

2 Viewpoint 5 is located west of Viewpoint 4, at the south end of Caribe Isle in the
3 BMK residential area. The view faces south towards HAAF. The viewshed
4 primarily consists of the south lagoon in the foreground and middle ground, and
5 distant views of flat farmland, rolling hills, and utility structures in the
6 background. Views from this viewpoint are unobstructed.

7 **Environmental Consequences and Mitigation**
8 **Measures**

9 This section describes the methods used to analyze potential impacts of the
10 restoration alternatives compared to the No-Action Alternative, potential impacts
11 and impact mechanisms of each restoration alternative, and recommended
12 mitigation measures to reduce significant impacts to a less-than-significant level.

13 **Approach and Methodology**

14 The impacts of the restoration alternatives were evaluated by analyzing the
15 change in the visual character of the BMKV site and the change in views of the
16 site from adjacent public areas and private areas within the BMK residential area.

17 The existing visual character was identified by visiting the site and taking
18 photographs from key vantage points (see figure 4-17 above). The future visual
19 character is based on the designs identified in chapter 3.

20 Visual lines of site were determined by using 2 elevations at the key viewpoints
21 to represent street-level/ground-floor views (13 feet NGVD—7 feet for street
22 level + 1.5 feet for foundation + 4.5 feet to viewer height) and second-story
23 views (23 feet NGVD—ground floor + 10 feet) from the ends of southward-
24 facing streets. Elevations of the existing site were identified from prior levee and
25 topographic surveys. Elevations of the future site with implementation of the
26 restoration alternatives were based on the conceptual designs described in
27 chapter 3.

28 The change in views resulting from building new or improved levees was
29 identified by graphing the line of site from the key viewpoints to features within
30 the restoration site affected by construction of the different alternatives.
31 Examples of the profiles generated for several of the key viewpoints are included
32 in appendix F for the three different alternatives.

1 **Impact Mechanisms**

2 The restoration alternatives include changing the existing aesthetic character of
3 the BMKV site from predominantly agricultural to a mosaic of grassland,
4 seasonal wetland, and tidal marsh. This would represent a change in the
5 character of the views from adjacent areas.

6 The restoration alternatives also include the construction of new levees and
7 improvement of existing levees and berms. These new and improved levees may
8 alter or obstruct existing views of the restoration site.

9 **Thresholds of Significance**

10 The following significance criteria were used to evaluate the proposed BMKV
11 expansion. Regarding aesthetics, the proposed expansion was identified as
12 resulting in a significant impact on the environment if it would

- 13 ■ substantially degrade the aesthetic character of BMKV from adjacent
14 viewpoints; or
- 15 ■ substantially obstruct existing unobstructed views of the BMKV site or of
16 San Pablo Bay from public viewing locations or a substantial number of
17 adjacent residences.

18 **Impacts and Mitigation Measures of the No-Action 19 Alternative**

20 Under the No-Action Alternative, no wetland restoration would occur, and the
21 expansion site would remain in its present condition. No change in the current
22 views would be anticipated, and no mitigation measures would be required.

23 **Impacts and Mitigation Measures Common to 24 Alternatives 1–3**

25 **Impact AE-1: Change in Aesthetic Character of BMKV 26 Site**

27 The existing views from certain public streets and private residences that face
28 directly onto the BMK south lagoon adjacent to BMKV include views of the
29 BMKV site itself. The restoration alternatives would replace the existing
30 agricultural fields, which dominate the existing view, with grassland, seasonal
31 wetlands, and tidal marsh. While this represents a change in the aesthetic

1 character of the BMKV site, the proposed restoration, particularly the tidal marsh
2 area, represents a return of the site to an approximation of the habitats and views
3 that were present prior to agricultural development. Individual viewers may have
4 subjective preferences for agriculture or for open space and habitat. However,
5 the aesthetic character of the BMKV site with implementation of the project is
6 expected to be generally perceived of as attractive and positive and aesthetically
7 equivalent overall to the existing agricultural character of the site. Thus, while
8 restoration would change the aesthetic character of the site, the restoration
9 alternatives are not expected to substantially degrade the aesthetic character of
10 the BMKV site and or the aesthetic character of existing views of the BMKV
11 site. The potential for obstruction of views is discussed separately below.

12 **Impacts and Mitigation Measures Unique to** 13 **Alternative 1**

14 **Impact AE-2: Obstruction of Existing Unobstructed Views** 15 **of BMKV Site and San Pablo Bay, Alternative 1**

16 The existing views from certain public streets and private residences that face
17 directly onto the BMK south lagoon adjacent to BMKV include views of the
18 south lagoon, the agricultural fields at BMKV, and, from elevated viewpoints,
19 San Pablo Bay in the background.

20 From the street level and ground floors in the residential area, the viewshed is
21 characterized by the BMK south lagoon in the foreground and agricultural fields
22 on the BMKV parcel (and its associated natural habitats) in the middle ground
23 and background. San Pablo Bay is visible in the far background from the street
24 level/ground floor, but it is a small portion of the background because of the
25 distance to the bay and the presence of the existing outboard levee. Views from
26 the second-story level are similar to ground-floor views but are substantially less
27 obstructed by existing levees, and San Pablo Bay is a distinct part of the
28 background.

29 Under Alternative 1, a new levee would be built approximately 1,000 feet east
30 and south of the south lagoon levee, at an initial elevation of approximately 12
31 feet NGVD, which includes a 4-foot allowance for settlement, resulting in a final
32 elevation of 8 feet NGVD. In addition, the existing south lagoon berm, which
33 presently varies between 2 and 5 feet NGVD, would be improved to an initial
34 elevation of approximately 10 feet, which includes a 4-foot allowance for
35 settlement, resulting in a final elevation of 6 feet NGVD.

36 The height of the new and improved levees would change a portion of the
37 existing views from the street level/ground floor. The upland transition
38 zone/swale area would be visible from the street level/ground floor. This view
39 would be similar to the existing views of the nearest portions of BMKV. In the
40 middle ground, the street-level/ground-floor view of the tidal marsh restoration

1 area would be obstructed by the new levee. In the background, the street level
2 ground floor view of San Pablo Bay would be obstructed by the new levee. No
3 change would occur to street-level/ground-floor views of the BMK south lagoon.

4 For second-story views, the lagoon, swale area, eastern part of the tidal marsh
5 restoration area, and San Pablo Bay would be still be viewable, but a portion of
6 the middle-ground view of the restoration area would be obstructed by the new
7 levee. The view of the San Pablo Bay would be similar to the existing view and
8 may be slightly improved by elimination of the outboard levee.

9 Under Bay Trail Spur Options 1A, a spur trail would provide public views of the
10 restoration site and San Pablo Bay from the central levee. Under Alternative 1,
11 views would also be available from portions of the Bay Trail itself.

12 The new levee would obstruct portions of existing views from street level/ground
13 floor for southward-facing homes in the southern part of the BMK residential
14 area, but it would have a limited effect on second-story views. While
15 unobstructed views would be available from the Bay Trail and from the optional
16 spur trail, if built, the partial obstruction of street level/ground floor views is
17 considered a significant impact.

18 The primary determinant of change in views is the height and location of the new
19 levee, which is designed to protect BMK south lagoon and residential area from
20 tidal flows introduced into the BMKV site. The primary mitigation measures
21 available for this impact would be to lower the levee heights of the south lagoon
22 levee improvement, lower the initial construction height of the new levees and
23 move the outboard levee location further away from the BMK residential area.

24 The final design height of the new outboard levee (8 feet NGVD) cannot be
25 lowered without compromising tidal flooding protection. Revised Alternative 2
26 considers an alternative initial construction height for the improvement of the
27 south lagoon levee of 6 feet NGVD (as opposed to 10 feet NGVD), an alternative
28 initial construction height for the new levee of 10 feet NGVD (as opposed to 12
29 feet NGVD), and an alternative location for the outboard levee further from the
30 BMK residential area. Were Alternative 1 to be implemented, the revisions in
31 levee heights and locations described in Revised Alternative 2 could be included
32 in Alternative 1 to reduce this impact to less than significant, although the levee
33 relocation would reduce the area available for tidal marsh restoration.

Impacts and Mitigation Measures Unique to Revised Alternative 2

Impact AE-3: Obstruction of Existing Views of BMKV Site and San Pablo Bay, Revised Alternative 2

As described in chapter 3, several changes were made to the design of Alternative 2, including changes that would affect the views of the BMKV site and San Pablo Bay. Under Revised Alternative 2, the new outboard levee would be built approximately 1,500 feet east and south of the south lagoon levee, at an initial height of approximately 10 feet NGVD, which includes a 2-foot allowance for settlement, resulting in a design height of 8 feet NGVD. The lowering of the initial construction height will require two additional levee raising efforts, one about 6 to 7 years after initial levee construction and one just prior to final outboard levee breaching (about 13 years after initial levee construction). In addition, the existing south lagoon levee, which presently varies in height between 2 and 5 feet NGVD, would be improved to an initial height of approximately 6 feet NGVD, which includes a 1-foot allowance for settlement, resulting in a design height of 5 feet NGVD. Furthermore, a spur trail would not be constructed as part of the Revised Alternative 2 design.

The height and location of the new and improved levees would change a portion of some of the existing views from the street level/ground floor. No change would occur to street-level/ground-floor views of the BMK south lagoon. In the foreground, the seasonal wetland and upland areas in the BMKV swale area would be visible from the street level/ground floor. This view would be similar to the existing views of the nearest portions of BMKV. In the middle ground, the street-level/ground-floor view of the western side of the tidal marsh restoration area would be obstructed by the new levee, although the eastern side of the tidal marsh restoration area would be visible. Over time, as the levee settles to its design height, a greater portion of the eastern part of the tidal marsh restoration area should become visible. In the background, the view of San Pablo Bay would be similar to the existing view and may be slightly improved by elimination of the existing outboard levee.

For second-story views, the lagoon, swale area, the eastern part of the tidal marsh restoration area, and San Pablo Bay would be viewable, but a portion of the middle-ground view of the western part of the tidal marsh restoration area would be obstructed by the new outboard levee. A greater part of the tidal marsh restoration area would be observable from second floors than from first floors. Over time, as the levee settles to its design height, a greater portion of the tidal marsh restoration area should become visible. The view of the San Pablo Bay would be similar to the existing view and may be slightly improved by elimination of the outboard levee.

The new levee would obstruct portions of existing views of a portion of the BMKV parcel from street level/ground floor for southward-facing homes in the

1 southern part of the BMK residential area, but it would not substantially change
2 views of San Pablo Bay. This alternative would have a limited effect on second-
3 story views. Views from the new Bay Trail would be unobstructed. The
4 obstruction of a portion of existing views from street level/ground floor for some
5 residences under Revised Alternative 2 represents the least amount of levee
6 encroachment on the existing lines of sight from this position in comparison to
7 Alternatives 1 and 3. The partial obstruction of some of the existing street-
8 level/ground-floor views of a portion of the BMKV is considered a less-than-
9 significant impact because the foreground views are preserved, the eastern part of
10 the tidal marsh restoration area would be visible, and the background views of
11 San Pablo Bay would be similar to those at present

12 **Impacts and Mitigation Measures Unique to** 13 **Alternative 3**

14 **Impact AE-4: Obstruction of Existing Views of BMKV Site** 15 **and San Pablo Bay, Alternative 3**

16 Under Alternatives 3, a new levee would be built approximately 50 feet east and
17 south of the eastern portion of the south lagoon levee, at an initial elevation of
18 approximately 12 feet NGVD, which includes a 4-foot allowance for settlement,
19 resulting in a final elevation of 8 feet NGVD. In addition, the western portion of
20 the existing south lagoon berm, which varies between 2 and 5 feet in elevation,
21 would be improved to an initial elevation of 10 feet NGVD, which includes a 4-
22 foot settlement allowance, resulting in a final elevation of 6 feet NGVD. The
23 height of the new and improved levees would change a portion of the existing
24 views from street level/ground floor and could affect views from second stories
25 of private residences.

26 From street level/ground floor, the proximity of the new levee to the viewpoints
27 would obstruct all views of the BMKV site and a portion of the background view
28 of San Pablo Bay under this alternative. For street-level/ground-floor views, this
29 impact would be more severe than the obstruction described above for
30 Alternative 1 and Revised Alternative 2. From second stories, the BMKV site
31 and San Pablo Bay would still dominate the views and would not be substantially
32 obstructed.

33 Under Spur Option 3A, a spur trail along the new levee would provide
34 unobstructed views of the restoration site and San Pablo Bay. Unobstructed
35 views would also be available along portions of the Bay Trail itself.

36 The new levee would obstruct existing views from street level/ground floor for
37 some of the southward-facing homes in the southern part of the BMK residential
38 area. Although unobstructed views would be available from the Bay Trail and
39 from the optional spur trail, if built, this is considered a significant impact.

1 The primary determinant of change in views is the height and location of the new
2 levee, which is designed to protect BMK south lagoon and residential area from
3 tidal flows introduced into the BMKV site. The primary mitigation measures
4 available for this impact would be to lower the levee heights of the south lagoon
5 levee improvement, lower the initial construction height of the new levees and
6 move the outboard levee location further away from the BMK residential area.

7 The final design height of the new outboard levee (8 feet NGVD) cannot be
8 lowered without compromising tidal flooding protection. Revised Alternative 2
9 considers an alternative initial construction height for the improvement of the
10 south lagoon levee of 6 feet NGVD (as opposed to 10 feet NGVD), an alternative
11 initial construction height for the new levee of 10 feet NGVD (as opposed to 12
12 feet NGVD), and an alternative location for the outboard levee further from the
13 BMK residential area. Were Alternative 3 to be implemented, the revisions in
14 levee heights and locations described in Revised Alternative 2 could be included
15 in Alternative 3 to reduce this impact to less than significant, although the levee
16 relocation would reduce the area available for tidal marsh restoration
17 significantly, compared to the habitat components contained in Alternative 3 at
18 present.
